PHILIPS

1. Technical Specifications and Connection Facilities

1.1 General:

Mains voltage	: 220V-240V (198 - 264V AC) for Europe/Asia
Mains frequency	: 50 Hz - 60Hz
Power consumption mains	: 32 W
Power consumption standby	: < 7 W
Power consumption low power stand-by	: < 3 W

1.2 RF Tuner

Test equipment: Fluke 54200 TV Signal generator
Test streams: PAL BG Philips Standard test pattern

1.2.1 System:

PAL B/G, PAL D/K, SECAM L/L', PAL I

1.2.2 RF - Loop Through:

Frequency range	: 45 MHz - 860 MHz
Gain: (ANT IN - ANT OUT)	: -4 dB \pm 2 dB

1.2.3 Radio Interference:

input voltage /3 tone method (+40 dB min)	: typ. 80 dB μ V at 75 Ω
---	-------------------------------------

1.2.4 Receiver:

PLL tuning with AFC for optimum reception	
Frequency range:	: 45.25 MHz - 860 MHz
Sensitivity at 40 dB S/N	: \geq 60dB μ V at 75 Ω (video unweighted)

1.2.5 Video Performance:

Channel 25 / 503,25 MHz, Test pattern: PAL BG PHILIPS standard test pattern, RF Level 74 dBV Measured on SCART 1	
Frequency response:	: 1 MHz - 4.00 MHz \pm 2 dB
Group delay (0.1 MHz - 4.4 MHz)	: 0 nsec \pm 30 nsec

1.2.6 Audio Performance:

Audio Performance Analogue - HiFi:

Frequency response at SCART 1 (L+R) output:	
	: 40 Hz - 15 kHz / \pm 1.5 dB

S/N according to DIN 45405, 7, 1967 : and PHILIPS standard test pattern video signal:	
	: -50 dB unweighted
Harmonic distortion (1 kHz, \pm 25 kHz deviation):	
	: 0.5 %

Audio Performance NICAM:

Frequency response at SCART 1(L+R) output:	
	: 40 Hz - 15 kHz \pm 1.5 dB

S/N according to DIN 45405, 7, 1967 : and PHILIPS standard test pattern video signal:	
	: -60 dB unweighted
Harmonic distortion (1 kHz):	
	: 0.1 %

1.2.7 Tuning

Automatic Search Tuning

scanning time without antenna	: 2.5 min. PAL
stop level (vision carrier)	: 75 V, 75
Maximum tuning error of a recalled program	: \pm 62.5 kHz
Maximum tuning error during operation	: \pm 100 kHz

Tuning Principle

automatic B,G, I, DK and L/L' detection
manual selection in "STORE" mode

1.3 Analogue Inputs

			Distortion and noise 1kHz	: >90dB
			Distortion and noise 20Hz-20kHz	: >80dB
			Intermodulation distortion	: >87dB
			Phase non linearity	: ± 1o max.
			Level non linearity	: ± 0.5dB max.
			Mute (spin-up, pause, access)	: >100dB
			Outband attenuation:	: > 50dB above 25kHz

(*) for 100% white

1.3.3 Audio/Video Front Input Connectors**Audio**

Input voltage	: 2 Vrms
Input impedance	: >10kΩ

Video - Cinch

Input voltage	: 1 Vpp ± 0.1V
Input impedance	: 75 Ω

Video - YC (Hosiden)

Input voltage Y	: 1Vpp ± 0.1V
Input impedance Y	: 75 Ω
Input voltage C	: burst 300 mVpp ± {x}
	dB
Input impedance C	: 75 Ω

1.3.4 Cinch Audio/Video Line Input Rear**Audio (EXT1)**

Input voltage	: 2 Vrms
Input impedance	: >10k Ω

Video (EXT4)

Input voltage	: 1 Vpp ± 0.1V
Input impedance	: 75 Ω

1.3.5 YC Input Rear (Hosiden; EXT3)

1	GND	
2	GND	
3	Input voltage Y 1Vpp ± 0.1V/ 75 Ω	
4	Input voltage C Burst 300 mVpp ± {x} dB/ 75 Ω	

1.4 Video Performance

All outputs loaded with 75 Ohm
SNR measurements over full bandwidth without weighting.

1.4.1 CVBS Output Rear (EXT4)

SNR Luminance	: > -65 dB
SNR Chrominance AM	: > -65 dB
SNR Chrominance PM	: > -65 dB
Bandwidth Luminance	: 5 MHz ± 1 dB

1.4.2 YC Output Rear (Hosiden ; EXT3)

SNR	: > -65 dB
-----	------------

1.4.3 SCART (RGB)

SNR	: > -65 dB on all output
Bandwidth	: 5 MHz ± 1 dB

1.5 Audio Performance**1.5.1 Cinch Output Rear**

Output voltage 2 channel mode	: 2Vrms ± 1.5dB
Output voltage 5.1 channel Dolby	: 1.41Vrms ± 1.5dB
Channel unbalance (1kHz)	: <0.85dB
Crosstalk 1kHz	: >105dB
Crosstalk 20Hz-20kHz	: > 95dB
Frequency response 20Hz- 20kHz	: ± 0.1dB max
Signal to noise ratio	: >100 dB
Dynamic range 1kHz	: >90dB
Dynamic range 20Hz-20kHz	: >88dB
Distortion and noise 1kHz	: >90dB
Distortion and noise 20Hz-20kHz	: >80dB
Intermodulation distortion	: >87dB
Phase non linearity	: ± 1o max.
Level non linearity	: ± 0.5dB max.
Mute (spin-up, pause, access)	: >100dB
Outband attenuation:	: > 50dB above 25kHz

1.5.2 Scart Audio

Output voltage 2 channel mode	: 2Vrms ± 1.5dB
Output voltage 5.1 channel Dolby	: 1.41Vrms ± 1.5dB
Channel unbalance (1kHz)	: <0.85dB
Crosstalk 1kHz	: >105dB
Crosstalk 20Hz-20kHz	: > 95dB
Frequency response 20Hz- 20kHz	: ± 0.1dB max
Signal to noise ratio	: >100 dB
Dynamic range 1kHz	: >90dB
Dynamic range 20Hz-20kHz	: >88dB
Distortion and noise 1kHz	: >90dB
Distortion and noise 20Hz-20kHz	: >80dB
Intermodulation distortion	: >87dB
Phase non linearity	: ± 1o max
Level non linearity	: ± 0.5dB max
Mute (spin-up, pause, access)	: >100dB
Outband attenuation:	: > 50dB above 25kHz

1.6 Digital Output**1.6.1 Coaxial**

CDDA/ LPCM (incl MPEG1)	: according IEC958
MPEG2, AC3 audio	: according IEC1937
DTS	: according IEC1937, amendment 1

1.6.2 Optical

identical to coaxial

1.7 Digital Video Input (IEEE 1394)**1.7.1 Applicable Standards**

Implementation according:
IEEE Std 1394-1995
IEC 61883 - Part 1
IEC 61883 - Part 2 SD-DVCR (02-01-1997)

Specification of consumer use digital VCR's using 6.3 mm
magnetic tape - dec.1994
Mechanical connection according:
Annex A of 61883-1

1.7.2 Audio Quality

Output voltage 2 channel mode	: 2Vrms +/- 1.5dB
Channel unbalance (1kHz)	: Tbd
Crosstalk 1kHz	: > 85 dB
Crosstalk 20Hz-20kHz	: > 95 dB
Frequency response 20Hz- 12kHz	: +/- 1dB max
Signal to noise ratio	: >95 dB
Dynamic range 1kHz	: tbd
Dynamic range 20Hz-20kHz	: Tbd
Distortion and noise 1kHz	: >65dB
Distortion and noise 20Hz-20kHz	: >65dB
Intermodulation distortion	: >80dB
Phase non linearity	: tbd
Level non linearity	: tbd
Outband attenuation	: tbd

1.8 P50 System Control

Via SCART pin nr 10

1.9 Dimensions and Weight

Height of feet	: 12mm
Apparatus tray closed	: WxDxH :435 x 325 x 107
Apparatus tray open	: WxDxH :435 x 465 x 107
Weight without packaging	: 5.67 Kg
Weight accesoiries	: 1.675 Kg

1.10 Laser Output Power & Wavelength

1.10.1 DVD

Output power during reading	: 0.8mW
Output power during writing	: 20mW
Wavelength	: 660nm

1.10.2 CD

Output power	: 0.3mW
Wavelength	: 780nm

2. Safety Instructions, Warnings, Notes, and Service Hints

2.1 Safety Instructions

2.1.1 General Safety

- Safety regulations require that during a repair:
- Connect the unit to the mains via an isolation transformer.
 - Replace safety components, indicated by the symbol , only by components identical to the original ones. Any other component substitution (other than original type) may increase risk of fire or electrical shock hazard.

Safety regulations require that after a repair, you must return the unit in its original condition. Pay, in particular, attention to the following points:

- Route the wires/cables correctly, and fix them with the mounted cable clamps.
- Check the insulation of the mains lead for external damage.
- Check the electrical DC resistance between the mains plug and the secondary side:
 1. Unplug the mains cord, and connect a wire between the two pins of the mains plug.
 2. Set the mains switch to the 'on' position (keep the mains cord unplugged!).
 3. Measure the resistance value between the mains plug and the front panel, controls, and chassis bottom.
 4. Repair or correct unit when the resistance measurement is less than 1 MΩ.
 5. Verify this, before you return the unit to the customer/ user (ref. UL-standard no. 1492).
 6. Switch the unit 'off', and remove the wire between the two pins of the mains plug.

2.1.2 Laser Safety

This unit employs a laser. Only qualified service personnel may remove the cover, or attempt to service this device (due to possible eye injury).

Laser Device Unit

Type	: Semiconductor laser GaAlAs
Wavelength	: 650 nm (DVD) : 780 nm (VCD/CD)
Output Power	: 20 mW (DVD+RW writing) : 0.8 mW (DVD reading) : 0.3 mW (VCD/CD reading)
Beam divergence	: 60 degree

Figure 2-1

Note: Use of controls or adjustments or performance of procedure other than those specified herein, may result in hazardous radiation exposure. Avoid direct exposure to beam.

2.2 Warnings

2.2.1 General

- All ICs and many other semiconductors are susceptible to electrostatic discharges (ESD, ) . Careless handling during repair can reduce life drastically. Make sure that, during repair, you are at the same potential as the mass of the set by a wristband with resistance. Keep components and tools at this same potential.
Available ESD protection equipment:
 - Complete kit ESD3 (small tablemat, wristband, connection box, extension cable and earth cable) 4822 310 10671.
 - Wristband tester 4822 344 13999.
- Be careful during measurements in the live voltage section. The primary side of the power supply (pos. 1005), including the heatsink, carries live mains voltage when you connect the player to the mains (even when the player is 'off!'). It is possible to touch copper tracks and/or components in this unshielded primary area, when you service the player. Service personnel must take precautions to prevent touching this area or components in this area. A 'lightning stroke' and a stripe-marked printing on the printed wiring board, indicate the primary side of the power supply.
- Never replace modules, or components, while the unit is 'on'.

2.2.2 Laser

- The use of optical instruments with this product, will increase eye hazard.
- Only qualified service personnel may remove the cover or attempt to service this device, due to possible eye injury.
- Repair handling should take place as much as possible with a disc loaded inside the player.
- Text below is placed inside the unit, on the laser cover shield:

3. Directions For Use

English

Introduction

DVD Video Recorder

DVD (Digital Versatile Disc) is the new storage medium that combines the convenience of the Compact Disc with the latest advanced digital video technology. DVD-Video uses instead of analog MPEG-2 data.

compression technology to register an entire movie on a single 5-inch disc. DVD provides better compression, running at up to 9.8 Mbit/sec and captures even the most complex pictures in their original quality. The crystal clear digital pictures have a horizontal resolution of over 800 lines, with 720 pixels (picture elements) in each line. This resolution is more than double that of VHS, superior to Laser Disc, and is fully compatible with digital masters made in recording studios.

DVD recording is the next step in video technology. DVD+Recordable (DVD+RW) uses phase-change media, the same technology that formed the basis for CD-R/Writable. A high-power laser is used to change the reflectivity of the recording layer. This process can be repeated more than a thousand times. DVD+Recordable (DVD+R) uses discs based on an organic dye. A technology pioneered with the successful CD-R. Recordable format, to produce data that keep your data for a lifetime.

Your Philips DVD recorder is a **recorder and player** for digital video discs, with a **two-way compatibility** in the universal DVD-Video standard. This means that:

- existing **pre-recorded DVD-Video** discs can be played on your Philips DVD recorder and
- **recordings**, made on your Philips DVD recorder, can be played on most DVD-Video players and DVD-RD21 drives.

With it, you will be able to record TV programmes or to edit and archive your own camcorder recordings. Superb digital picture and sound quality, quick access to the tracks you have recorded and multiple playback features contribute to a completely new video experience.

From now on you will enjoy full-length movies with top cinema picture quality, and plenty of Multi-channels (sound depending on the disc, and on your playback set up). You will find your recorder remarkably easy to use, by way of the On-Screen Display on your TV and the display on the DVD recorder, in combination with the **remote control**.

Box contents

First check and identify the contents of your DVD recorder package, as listed below:

- DVD recorder
- Remote Control (bundled with separately packed batteries)
- AC cord power cord
- SCART cable
- S-video cable
- Antenna (separately cable)
- Audio cable
- Video cable
- DVD-RW disc
- User Manual
- Warranty card

If any item should be damaged or missing, please inform your supplier without delay.

Keep the packaging materials; you may need them to transport your recorder in the future.

Placement

- Place the recorder on a firm, flat surface.
- Keep away from domestic heating equipment and direct sunlight.
- In a cabinet, allow about 2.5 cm (1 inch) of free space all around the recorder for adequate ventilation.
- The lens may cloud over when the DVD recorder is suddenly moved from cold to warm surroundings. Playing a CDDVD is not possible then. Leave the DVD recorder in a warm environment for two hours before use, so the moisture can evaporate.
- The recorder should not be exposed to dripping or splashing, no objects filled with liquid, such as vases, should be placed on the recorder.

Cleaning discs

Some problems may occur because the disc inside the recorder is dirty. To avoid these problems clean your discs regularly, in the following way:

- When a disc becomes dirty, clean it with a cleaning cloth. Wipe the disc from the centre out.

Caution:

Do not use solvents such as benzine, thinner, commercially available cleaners, or abrasive spray intended for analogue discs. Do not use commercially available cleaning discs to clean the lens, as these discs may damage the optical unit.

Remote control

Loading the batteries

- Open the battery compartment cover.
- Insert two AA (LR6) batteries as indicated inside the battery compartment.
- Close the cover.

Caution:

Do not mix old and new batteries. Never mix different types of batteries (standard, alkaline, etc.). This may reduce the lifetime of the batteries.

Installation

Connections - back side of your DVD recorder

• Please refer to your TV set, VCR, Stereo System and any other User Manual(s) as necessary to make the optimal connections.

• Do not connect the power until all other connections are made.

• Do not connect your DVD recorder to your TV set via your VCR, because the video quality could be disturbed by the copy protection system.

For better sound reproduction you can connect the recorder audio outputs to your amplifier, receiver, stereo system or A/V equipment, for this see "Connecting to A/V receiver or A/V amplifier".

Caution:

Do not connect the recorder's audio output to the phono input of your audio system in order to avoid damage to your equipment.

Connecting to the antenna

- Remove the antenna (serial) cable plug from your TV set and insert it into the antenna socket at the back of the DVD recorder.
- Plug one end of the antenna (serial) cable supplied (1) into the TV socket on the DVD recorder and the other end into the antenna input socket on your TV set.

Connecting to a TV set

To obtain the highest possible picture and sound quality from your TV set it is recommended to use the **coaxial connector** on both DVD recorder and TV set.

- Connect the bottom coaxial connector (BKT 7) to the TV set, using the coaxial cable supplied (2) as shown in the drawing. If your TV set is equipped with EasyLink or CinemaLink, make sure you use the correct coax connector. For this refer to the user manual of your TV set.

If your TV set is not equipped with a coaxial connector, you can connect the DVD recorder with the S-video (Y/C) sockets.

S-video (Y/C) connection

- Connect the S-video output socket to the corresponding input socket on the TV set, using the supplied video cable (3).
- Connect the audio (left (white) and Right (red)) output sockets to the corresponding sockets on the TV set using the audio cable supplied (5).

If your TV set is not equipped with S-video sockets, then connect the DVD recorder with the CVBS sockets to your TV set.

Video (CVBS) connection

- Connect the Video (CVBS) output socket (yellow) to the corresponding input socket on the TV set, using the video cable supplied (4).
- Connect the audio (left (white) and Right (red)) output sockets to the corresponding sockets on the TV set using the audio cable supplied (5).

Connecting to audio equipment

Connecting to A/V receiver or A/V amplifier with digital Multi-channel decoder

The best possible sound quality is obtained by connecting your DVD recorder to an A/V receiver with Multi-channel decoder (Dolby Digital, MPEG 2 and DTS).

Digital Multi-channel sound

Digital Multi-channel connection provides the optimum sound quality. For this you need a Multi-channel A/V receiver that supports one or more of the audio types supported by your DVD recorder (MPEG 2, Dolby Digital and DTS). For this you can check the receiver manual as it shows on the front of the receiver.

- Connect the recorder's digital audio output to the corresponding input on the receiver. Use a digital audio cable (6) or a digital optical audio cable (8).

If you do not have a digital optical audio cable input supplied, you may use the supplied video cable (8).

Note:

If the audio type of the digital output does not match the capabilities of your receiver, the receiver will produce a strong distorted sound. The audio type of the DVD disc is always displayed in the Status Window when changing the language. A Channel Coded Forward Sound via digital connector can only be obtained if your receiver is equipped with a digital Multi-channel decoder.

If you cannot connect your DVD recorder to an A/V receiver with Multi-channel decoder, choose one of the following alternatives:

Connecting to a receiver equipped with two channel digital stereo (PCM)

- Connect the recorder's digital audio output to the corresponding input on your receiver. Use the supplied video (CVBS) cable (7) or an optional digital optical audio cable (8).
- After installation you will need to activate PCM on the DVD recorder's digital output from User Preferences).

Connecting to a receiver equipped with Dolby Pro Logic

- Connect the recorder to the TV set and connect the recorder's audio (left and Right) output sockets to the corresponding inputs on the Dolby Pro Logic Audio/Video receiver, using the audio cable supplied (5).

- Make the appropriate Sound settings for Analog Output in the user preferences menu.

Connecting to a TV set equipped with a Dolby Pro Logic decoder

- Connect the recorder to the TV set as described in chapter "Connecting to a TV set".

Connecting to a receiver with two channel analogue stereo

- If you have a receiver with two channel analogue stereo without any of the above mentioned sound systems, connect the audio (left and Right) output sockets to the corresponding sockets on your receiver, amplifier or stereo system. Use the audio cable supplied (5).

Connecting to other equipment

Use the top input connector (EXT 2) on your DVD recorder to make connections to:

- Satellite receiver or Set top box.
- VCR.
- DVD Video player.

Most pre-recorded video cassettes and DVD discs are copy protected. If you try to copy them the display shows "COPY PROTECT".

For installation of a decoder, see "User Preferences" - "Available".

Notes:

- If the power is off or Low Power Standby is selected per User Preferences - (standby), the signal from EXT 2 will not be passed on to the TV set on EXT 1.

- CopyLink functionality will not be available to devices connected via the DVD recorder's EXT 2 to the camcorder.

Connections - frontside of your DVD recorder

Camcorder connection

- If you have a DV or Digital8 camcorder, connect the Link DV input socket (1) to the corresponding output socket on the camcorder using the Link cable of your camcorder.
- If you have a Hi8 or S-VHS(C) camcorder, connect the S-video input socket to the corresponding output socket on the camcorder using the S-video cable supplied (2) and connect the audio cable (4) supplied.
- Otherwise, connect the Video input socket (yellow) to the corresponding output socket on the camcorder using the video cable supplied (3) and connect the audio Left (white) and Right (red) input sockets to the corresponding sockets on the camcorder using the audio cable (cable 4) (4).
- If your camcorder has stereo output, use only the left audio connector. In this case the sound will be recorded on both audio channels.

Power supply

- Make sure that all necessary connections are made before connecting the DVD recorder to the power supply.
- Plug the power cable (cable) into the Power connector on the rear of the recorder.
- Plug the main plug into an AC outlet.

Notes:

Always check if the local mains voltage matches the required 230V - 240V.

When the recorder is in the Standby position, it will consuming some power.

If you wish to disconnect your DVD recorder completely from the mains, withdraw the plug from the AC Outlet. When the DVD recorder is disconnected from the mains, TV channels and timer data will be stored typically 1 year.

Switching on

- Switch on the TV set and select the programme number that you have chosen for video playback (see operating manual for your TV set).
- Press **STANDBY/ON**.
 - ▶ If the recorder display lights up, if you have not yet installed your DVD recorder, it will enter "Virgin mode". In this mode you will have to set your personal preferences.

First time set-up: virgin mode

After switching on the DVD recorder for the very first time the "Virgin mode screen" will appear.

In "Virgin mode" you may have to set your preferences for some of the recorder features.

If the "Virgin mode screen" does not appear, your DVD recorder has been installed already. You may still change the settings via the installation menu. Depending on the kind of TV set, preferences will have to be set manually or they will be taken over automatically from the TV set.

Automatic setting

When your TV set is equipped with EasyLink, Cinema Link, NetView (net), SmartLink, Q-Link or PlayAgain, the TV settings will be taken over from the TV set but they cannot be changed manually afterwards.

When preferences are taken over from your TV set, the message "EasyLink loading data from TV, please wait" will appear.

Menus for which no preferences are available will be displayed. They have to be set manually.

Also:

Preferences have to be set in the system which the user manual will appear on the screen.

If the recorder is switched off while setting user preferences, all preferences have to be set again after switching the recorder on again.

The "Virgin mode" will only be concluded after the preferences for the last step have been confirmed.

Manual setting

When a menu is displayed:

- Use the **Up** (down) arrow keys to go through the options in the menu. The option of the selected option will be highlighted.
- Use **OK** to confirm your selection and to select the next screen.

The following items may have to be set in single mode.

Menu language

The on-screen menus of DVD-Video discs will be displayed in the language you choose.

Audio language

The audio of DVD-Video discs will be in the language you choose, provided this is available on the disc in play. If not, speech will revert to the first spoken language on the disc. Also the DVD-Video disc menu will be in the language you choose (provided this is available on the disc).

Subtitle language

The subtitles of DVD-Video discs will be in the language you choose, provided this is available on the disc in play. If not, subtitles will revert to the first subtitle language on the disc.

TV Shape

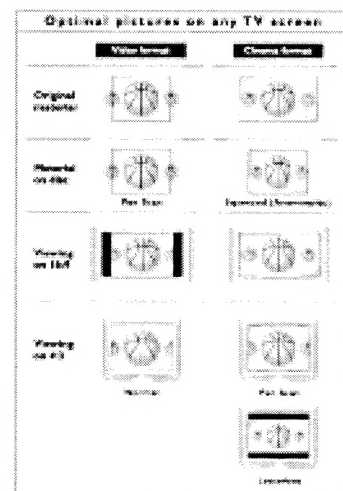

You can choose:

- **16:9** if you have a wide screen (16:9) TV set.
- **4:3** if you have a regular (4:3) TV set. In this case you can also choose between:

• **Letterbox** for a wide screen picture with black bars at the top and bottom.

• **Pan Scan** for a full height picture with the sides trimmed. If a disc has Pan Scan, the picture then moves (scrolls) horizontally to keep the main action on the screen.

Country

Select your country. This is used as input for some 'Parental Control' features (also 'Access Control') as well as the switching of TV channels.

Auto TV Channel Search

Make sure the antenna is connected. See 'Connecting to the antenna'. Your DVD recorder will search for all TV channels.

It stores channels in the sequence they are found.

- **Go on with OK**
 - ▶ **Auto search is done.** This can take several minutes.

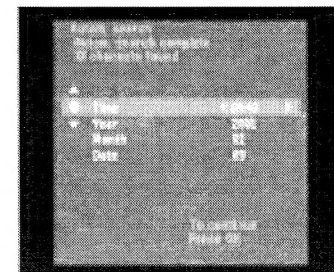

- ▶ When Auto search is completed, **Auto search complete XX channels found** appears on the TV screen.

After Auto channel search you can have TV channels stored automatically in the same order as your TV set. See 'User preferences (Installation)' - Follow TV.

Time/Date

When Channel auto search is completed the actual Time and Date are also set automatically. If the time as the DVD recorder displays is not correct, the clock must be set manually.

- Adjust **Time** Year, Month, Date if required, with the **Up** (down) cursor or **Right** (cursor) key.
- Change values with the **Left** (left) cursor or **Left** (right) cursor key or the digit keys **0-9**.
- To end, press **OK**.

Note:

All these items may have to be set after first start up (initial mode). After that they can always be adjusted in the user preferences menu. When your TV set is equipped with daylight the TV set preset will be taken over from the TV set but they cannot be changed manually afterwards.

Single mode settings are now completed. All settings can still be changed. See 'User preferences'.

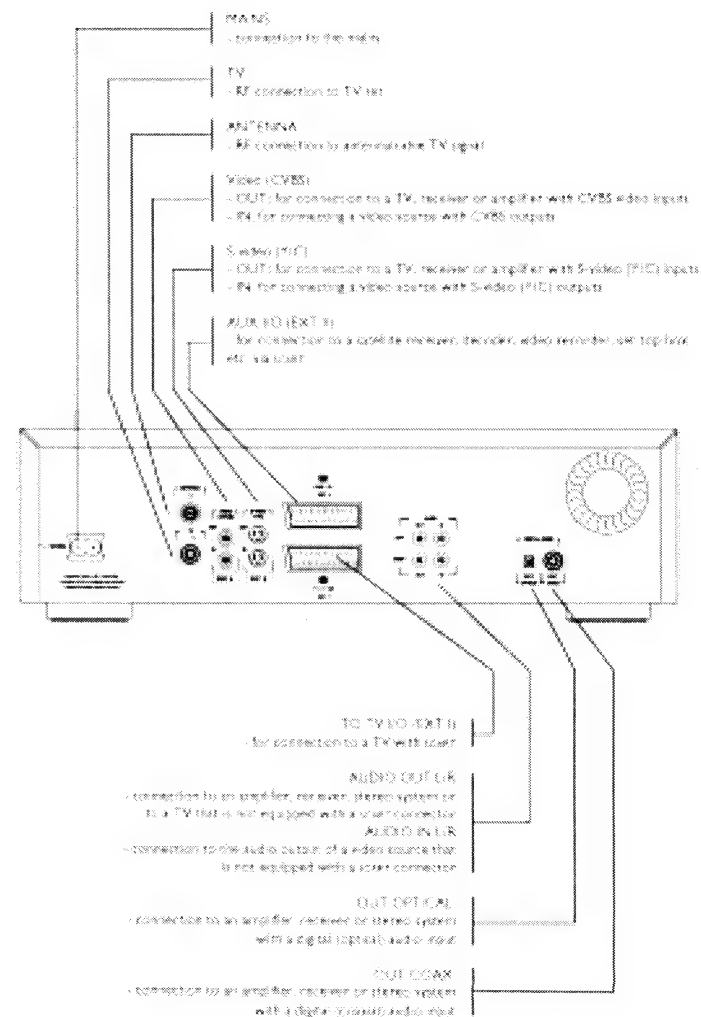

Functional overview

Front of recorder

14 FUNCTIONAL OVERVIEW

Rear of recorder

FUNCTIONAL OVERVIEW 15

Operation

Important notes for operation

You can switch on the DVD recorder with the **(1) STANDBY/ON** key. Keep your DVD recorder connected to the mains at all times to ensure that programmed recordings can be made and that the television functions normally.

Both the DVD recorder and the remote control have an "Emergency interrupt" button. You can use the **(1) STANDBY/ON** button to interrupt a function. When you have an operating problem, you can interrupt the function and start again.

When you switch off the DVD recorder, the display will briefly show "OFF".

Loading discs

- Press **(1) OPEN/CLOSE** on the front of the recorder. The disc loading tray opens.
- Lay your chosen disc in the tray, label side up. Make sure it is sitting properly in the correct recess.
- Press **(1) OPEN/CLOSE** to close the tray. **▶▶▶▶▶▶▶▶** appears in the status row and on the on-screen display. If the inserted disc is pre-recorded or write-protected, playback starts automatically.

You can always unload a disc by pressing **(1) OPEN/CLOSE** again or pressing **(2) STOP** on the remote control for two seconds.

Note:

If "Child Lock" is set to ON and the disc inserted is not in the "Child safe" list, the disc cannot be played. The RN code must be entered on the disc tray to be authorized. See "Access Control".

Disc types

This will recognize the different types of discs that can be used in your DVD recorder by the logo. Depending on the disc type you can either use it for recording and playback or playback only. Some discs are not suitable at all to be used in the DVD recorder.

In the next table a summary is given of all occurring disc types and their DVD recorder compatibility.

The following disc types can be used for recording and playback:

DVD+RW

Records and plays in case of a new blank disc, after the first recording, some more time (up to two minutes) is needed to make the disc compatible with DVD-Video players.

DVD+R

Records and plays.

The following disc type can be used for playback only:

DVD-Video

DVD-R

Only plays if it contains DVD-Video.

DVD-RW

Only plays if it is recorded in Video mode and has been finalized.

CD Digital Audio

You can play digital audio CDs in conventional style through a stereo system, using the keys on the remote control and/or front panel or via the TV set using the on-screen display (OSD).

Super Audio CD

Of typical SACD discs, the CD type can be played.

(Super) Video CD

Depending on the material on the disc (i.e. movie, video clip, a theme series, etc.) these discs may have one or more tracks, and tracks may have one or more indexes, as indicated on the disc case. To avoid scenes and content, you'll need to use your remote to move between tracks and between indexes.

CD-i/CD-RW

Plays if it contains Audio CD or MP3 material.

The following disc types cannot be used at all, neither for recording nor for playback:

DVD-RAM

DVD-Audio

On-screen display information

System menu bar

The system menu bar can be called up by pressing any of the following keys on the remote control: **SYSTEM**, **MENU**, **T/C**, **CH**, **ANGLE**, **SUBTITLE**, **AUDIO** and **TV**, **ZOOM**.

Widescreen (16:9) TV sets may show only part of the system menu bar in certain screen modes. Select a different screen mode on the TV to see the full menu. A number of recorder functions can be controlled via the system menu bar. You can navigate between the two parts of the system menu bar with the **(1)** (left) cursor and the **(2)** (right) cursor key.

System menu bar items

PART 1	PART 2
T/A User preference	+ Sound
T Title/Track	← Step motion
Q Chapter/Index	→ Slow motion
AL Audio language	↑ Fast motion
SL Subtitle language	↓ Time search
CH Angle	
RL Zoom	

Temporary Feedback Field

The system menu bar contains a "Temporary Feedback Field" with information concerning prohibited actions (playback modes, available angles, etc.).

English

English

- Scan
- Repeat All
- Repeat Title
- Repeat Track
- Repeat Chapter
- Repeat A to end
- Repeat A-B
- Angle
- Child Lock On
- Child Safe
- Resume
- Action prohibited

User preference menu operation

- Press **SYSTEM MENU** on the remote control.
- Select **TA** on the system view bar and press **12** (green button).
 - The user preference menu appears.
- Use the **1**, **2**, **3**, **4** (left/right/up/down cursor) keys to toggle through the menu, sub-menus and sub-menu options.
 - When a menu item is selected, the cursor keys (on the remote control) to operate the item are displayed next to the item.
- Press **OK** to confirm and return to the main menu.

The following functions can be operated via the user preference menu.

User preference menu icons

- Picture settings
- Sound settings
- Language settings
- Feature settings
- Remote control settings
- Record settings
- Installation

- You can navigate between the various items of the user preference menu with the **1**, **2**, **3**, **4** (up/down/left/right cursor) key. To select an item press **12** (right cursor) key.

- By pressing **SYSTEM MENU** the system menu bar will disappear from the screen.

Status box

The status box on the left hand side of the screen displays the current status of the recorder and the day type loaded for several seconds.

Disk type icons

- DVD-RW
- DVD-R
- DVD-Video
- Super Video-CD
- Video-CD
- no disc
- disc error

Disk status icons

- recording
- stop
- play
- pause play
- record pause
- erasing
- fast forward
- fast reverse
- slow motion

Tuner info box

The tuner info box is located at the bottom left of the screen and is displayed in monitor mode *disc Recording*. Checking inputs to display the currently selected input. When the tuner is selected it shows programme number and/or channel name.

- Current channel
- No signal
- Copy-protected signal

Timer info box

The timer info box is located above the tuner info box, and is displayed in monitor mode. It displays the current status of the timer.

When a timer is programmed it shows a timer indication and the start time or date of the first programmed recording.

- Timer about start today
- Timer about start on another day

When an OTA recording is in progress it shows the end time.

- OTA recording in progress

When no timer is programmed it displays the current time.

- Current time

Note:
Tuner info box and timer info box automatically disappear after a few seconds.

Warning box

The warning box will be displayed near the bottom of the screen when appropriate. For instance: **Disc locked**.

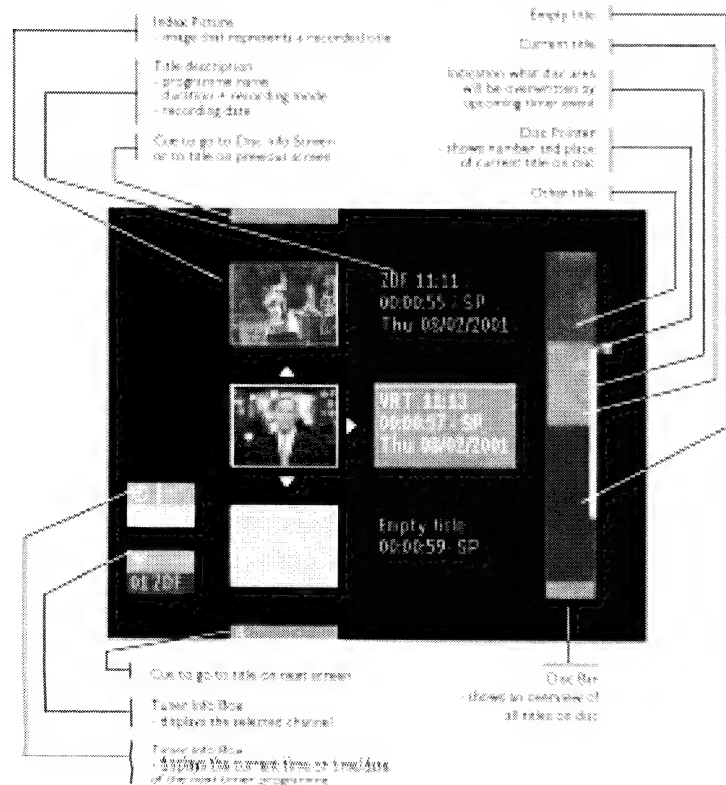

Index Picture Screen

The Index Picture Screen displays an overview of the data recorded on the disc. Each title is represented by an index picture. Next to the index picture the programme name, duration, recording mode and recording date of the title are shown. If no name is known, the DVD recorder will fill in the word *empty* and the time of the recording instead.

Empty spaces (unused titles or blank space at the end of the disc) are also shown as such.

- At maximum three titles will be shown on the screen at once. If more titles are present, you can navigate to those with the **UP**, **DOWN** or **RIGHT** buttons.

- On the right hand side of the Index Picture Screen, you can see the disk bar. This gives an overview of all titles on the disc, as well as any empty space. On the disk bar, an arrow - the disk pointer - indicates your current position on the disc. From this point you may resume playback or recording.
- If you navigate through the list of titles with **UP**, **DOWN**, **LEFT** or **RIGHT** (or **PREVIOUS** / **NEXT**), the disk pointer will move along.
- Press **STOP** to return the disk pointer to the beginning of the disc.
- To move the disk pointer to the end of the last title, keep **NEXT** pressed.
- If you navigate from an Index Picture to the back right, next to it (positioning, output, on-screen etc.) you enter the title settings menu (see under "Managing disc content" - Title settings).

User preferences

Setting user preferences

You can set your user preferences for some of the receiver features (see "Operation" - User preferences menu operation).

The following items can be adjusted:

Picture settings

TV Shape

With TV Shape you can adjust the output of your DVD Recorder to optimally fit your TV screen. You can choose:

- 16:9** if you have a wide-screen (16:9) TV set
- 4:3** if you have a regular (4:3) TV set. In this case you can also choose between:

- Letterbox** for a wide-screen picture with black bars at the top and bottom.

- Port Scan** for a full height picture with the sides trimmed. If a disc has Pan Scan, the picture then moves (pan) horizontally to keep the main action on the screen.

Optimal pictures on any TV screen

	Wide format	Normal format
Original material		
Material on DVD		
Viewing on 16:9		
Viewing on 4:3		

Black level shift (NTSC only)

Adjusts the colour dynamics to obtain richer contrasts. Select **On** or **Off**.

Video shift

Factory setting is such that the video will be centred on your screen. Use this setting to adjust the position of the picture on your TV set by moving it to the left or right.

Scan Video

Factory setting is RGB. Select **S-video** (Y/C) via SCART when connecting to an S-video recorder.

Sound settings

Digital output

Factory setting **Off** means that both coaxial and optical outputs are switched on, and that Dolby Digital Multi-channel is fed to the outputs as such. If your equipment does not include a digital Multi-channel decoder, set the digital output to **Pulse** (Pulse Code Modulation). Both coaxial and optical outputs are then switched on, and Dolby Digital and MPEG audio are converted to PCM. If you are not connecting equipment with a digital input, change the setting to **Off**.

Analogue output

Select **Stereo**, **Surround** or **3D Sound**. Factory setting is **Stereo**.

- Surround:** Select this setting when using equipment with a Dolby Surround Pro Logic decoder. In this setting the 5.1 audio channels (Dolby Digital, MPEG-1) are downmixed to a Surround compatible 2 channel output.
- 5.1 Surround:** In a setup without rear speakers (analogous stereo system), this option remaps the six channels of digital surround (Dolby Digital, MPEG-1) into a two speaker output, while retaining all of the original audio information. The result is the listening sensation of being surrounded by multiple speakers.

Connected audio system	Digital out	Analog out
Amplifier or TV with two channel analogue input	Off	Stereo
Amplifier or TV with Dolby Surround or Dolby Pro Logic	Off	Surround
Amplifier with two channel digital input	PCM with stereo	Stereo
AV system with Multichannel decoder (Dolby Digital, MPEG-1)	On	Stereo or Surround
Multichannel AV system with both connectors	Off	Surround

Night Mode

Night mode optimizes the dynamics of the sound with low volume playback for less disturbance in quiet environments. This only works for Dolby Digital audio on DVD-Video discs.

Language settings

The preferred language can be adapted via the system menu bar. Also see "Input mode". Settings can be changed for:

- Playback audio language
- Subtitle language
- Menu language
- Country setting

Feature settings

Access Control

Access Control contains the following features:

- Child Lock** - When Child Lock is set on, a 4-digit code needs to be entered in order to play discs.
- Parental Level** - Allows the conditional presentation of DVD discs containing Parental level information.
- Change country** - Allows conditional presentation of DVD-Video discs containing country information.
- Change code** - To change the pin code.

See *Access Control*.

Adapt disc format

This option is only available when a DVD-RW or DVD-R disc recorded on a different brand of recorder is loaded. You can adapt the menu to your own recorder.

A DVD+RW/R disc that has been recorded on a different type or brand of recorder can be played, but may not provide all features currently available to DVD+RW/R discs, such as the on-screen disc, fan-the-disc settings menu, the title settings menu, and editing of the disc if not write-protected. The disc format can be adapted to the own recorder, after which these functions are available.

Status bar

The status bar displays the current status of the recorder and the disc type loaded (see "Operation" - "On-screen display information"). You can switch it On or Off.

Off = always Off

On = displayed together with the system status bar or displayed temporarily (disappears after one call)

When changing the playback or record status.

Factory setting is On.

Auto resume

The Auto resume setting only applies to pre-recorded DVD-Video and Video CD discs only - not only to the disc in the recorder but also to the last twenty discs you have played.

If **Auto resume** is set to On, playback will start from the point where it was stopped the last time the disc was played.

When **Auto resume** is set to Off, the recorder will start playing from the beginning of a disc. In this case you can still resume when **FF** appears or forward by pressing **▶ PLAY**. Factory setting is On.

Low power standby

If low power standby is On, the recorder will consume minimum power in standby mode.

Factory setting is Off.

Menu

When the recorder is in low power standby mode, the content of the equipment connected to EXT 2 will not be forced through to the TV set on EXT 1.

- the Display will be Off.
- the Standby indicator on the recorder will still light up in standby mode.

PRC

This feature is only available when a (Super) Video CD is loaded. It allows you to disable or enable the PRC (Playback Control) menu of VCD discs. See under "Special VCD features". Factory setting is On.

Finalise disc

This option is only available on unfinalised DVD+R discs. See "Managing the system" - "Finalising a DVD+R disc".

Remote Control settings

Key sound

The recorder makes a beep sound upon every key command given via recorder or remote control keys. Select Off to disable this sound. Factory setting is On.

Remote control used

If you want to use the remote control of a Philips DVD player instead of the standard DVD recorder remote control, select "MX player". Factory setting is "MX recorder".

System information

When you move the cursor down in the Remote Control settings menu, the system status screen will appear. Press **▶** status up to go back.

Record Settings

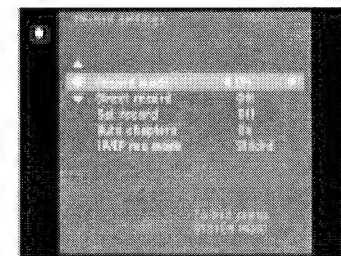

Record mode

By selecting a recording mode you define picture quality of recordings and maximum recording time for a disc.

Mode	Picture quality	Total recording time
HQ	best possible picture quality	60 minutes
High Quality		
SP	pre-recorded DVD quality	120 minutes
Standard Play		
SP+	pre-recorded DVD quality	120 minutes
Extended Play 1		
LP	better than VHS picture quality	160 minutes
Long Play		
LP	better than VHS picture quality	240 minutes
Extended Play 2		
LP+	better than VHS picture quality	240 minutes
Extended Play 3		

In practice, the DVD recorder may record a few minutes more than indicated. For playback, the correct recording mode will automatically be selected. The HQ mode is optimized for recording via the iLink Fire input. For all other sources use SP, SP+, LP, LP+ or LP+.

- In the record settings menu, select **Record mode**.

- After the recording mode with **▶** or **◀** left/right button.
- Confirm with the **OK** key.
- To end, press **SYSTEM MENU**.

An alternative way to select the record mode is available in the Input Return Screen and in standby mode.

- Press **SELECT**.
- The new record mode appears on the screen and the display.

It is not possible to switch record modes during recording.

Direct record

With the Direct Record function switched ON, the DVD recorder switches to standby the channel number selected on your television will be automatically taken over by the DVD recorder at the moment it starts recording. This only applies for televisions connected via SCART, which have video output via SCART or which have EasyLink[®] Factory setting is OFF.

- In the record settings menu, select **Direct record**.
- Select **OFF**. If you select **ON**, the function will be switched on.
- Confirm with **OK**.
- To end, press **SYSTEM MENU**.

Sat record

You can only use this function when you have a satellite receiver, which can control other equipment by a programming function. In this mode your DVD recorder starts recording when the satellite receiver releases a signal. The start and end of the recording is controlled via one of the socket sockets.

- In the record settings menu, select **Sat record**.
- Select the socket socket EXT1, EXT2 (to which the satellite receiver is connected with a cable) (left/right cursor).
- Confirm with **OK**.
- Insert a recordable DVD-RW disc.
- Press **STANDBY/ON**.
 - ▶ When this function is switched on, SAT appears on the display.
 - ▶ The DVD recorder is now prepared for recording.

Factory setting is OFF.

Auto chapters

If auto chapters is ON every time the recorded chapter marker (beginning of a new chapter) is started during recording. This enables easy navigation through a title during playback. In either case you can manually insert chapter markers afterwards. (See 'Managing disc contents' - E18 in playback mode.)

Filter Mode

In long play or extended play recording mode you can select the **Sport** setting to optimize the video recording for bright, fast content but compressing like sports programming. The settings does not influence high quality or standard play recording mode.

Factory setting is **Standard**.

Installation

Auto TV Channel Search

Your DVD recorder will search for all TV channels. If storing channels in the programme diary are found. (See Installation - First time Set-up.)

None.

All channels found so far will be stored.

Follow TV

With Follow TV you can programme the same channel sequence on the DVD recorder as on the TV set. This only functions if the recorder socket (EXT1) and the TV set are connected with a SCART cable. Additional equipment connected to socket EXT2 must be switched on.

- Press **OK**.
 - ▶ If the DVD recorder recognizes that the TV set has been connected with a SCART cable, TV-F appears on the display.

TV-F

- When TV-F appears on the display, the TV channels can not be deleted automatically in the data read Manual TV channel search.
- Select programme number 1 on the TV set.
- Confirm with **OK** on the remote control of the DVD recorder.
 - ▶ The DVD recorder compares the TV channels on the TV set and the DVD recorder. If the channels match, the channel is stored at P01.
- Wait until TV-F appears and repeat the previous two steps for programme number 2 and the rest of the channels you want to store.
- To end, press **SYSTEM MENU**.

Manual TV channel search

You can perform a search to select and store TV channels manually. If the DVD recorder is connected via EasyLink, this function is not available.

- Press **SYSTEM MENU**.
- Select **Installation**.
- Select **Manual search**.
- In the line **Channel freq.** select the display for **freq.** (frequency) or **ch.** (channel) or **S-CH** (special channel).
- If you know the frequency or channel of the desired TV channel, you can enter the data in line **Enter search** with the digit keys **0-9**. If you don't know the frequency or channel of the TV channel of your choice, press **2** (right cursor) to start channel search.
- In the line **Programme number** select the programme number you want, using **0-9** (left/right cursor) or digit keys **0-9**.
- If you want to change the TV channel name, press the **2** (right cursor) key in line **TV channel name**.
- Select the character you want to change with the **0** (left cursor) or **2** (right cursor) key.
- Change the character with the **0** (down cursor) or **2** (up cursor) key.
- Press **OK** to confirm.

The DVD recorder can receive HIFI sound transmissions in HiFi/AM Stereo. However, if sound transmission occurs, the TV sound is split, you can switch off HiFi/AM.

- In the line **HiFi/AM** select **On** or **Off** with the **0** (left cursor) or **2** (right cursor) key. If you want to change the automatic TV channel setting, select the line **Auto tuning**. With the **0** (left cursor) or **2** (right cursor) key you can select the automatic TV channel setting.

Important: This recording is only necessary and useful in special cases, e.g. when errors appear on your TV screen when using a cable TV system.

- Press **OK** to store the TV channels.
- To end, press **SYSTEM MENU**.

Connecting a decoder

- Switch on the TV set and select the programme number for the DVD recorder.
- Select the TV programme you wish to link with the decoder function with **CH+** or **CH-**.
- Press **SYSTEM MENU**.
- Select **Installation**.
- Select **Manual search**.
- Select **Decoder**.
- Select **On** with **0** (left cursor) or **2** (right cursor).
- Confirm with **OK**.
 - ▶ **DECODE** appears on the display.
- To end, press **SYSTEM MENU**.

Sort/Clear TV channels manually

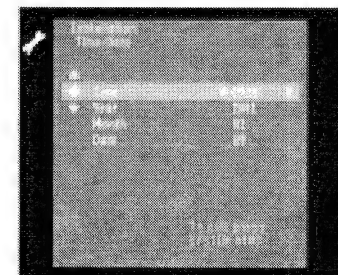

- If the DVD recorder is connected to the TV set with EasyLink or a similar system, manual sort cannot be executed. In all other cases, you can select:
 - Press **SYSTEM MENU**.
 - Select the line **Installation**.
 - Select the line **Sort TV channels**.

- Select the TV channel to which you want to allocate a programme number starting with **P01** (with the **0** (left cursor) or **2** (down cursor) key and press the **2** (right cursor) key).
- Select the desired position with **0** or **2** (up/down cursor) key.
- To store, press **OK**.
- If you want to delete a channel from the programme list, press **CLEAR** when you have selected the channel.
- To end, press **SYSTEM MENU**.

Time/Date

To adjust **Time**, **Year**, **Month** and **Day** with the digit keys **0-9**. Switch between fields with the **2** (down/up cursor) keys.

Recording

Before you start recording

Recordings on a DVD-RW disc are called titles. Every title consists of one or more chapters.

For more information about how to go to other titles or chapters, see "Playback - general features".

Important:

Recordings on a DVD-RW disc are normally started from the position of the so-called disc pointer, i.e. the point where the last recording was stopped. From there on earlier recordings may be overwritten without notice, unless the disc is write-protected. In this respect your DVD recorder behaves just like a Video Cassette Recorder.

If you want to make a recording without the risk of overwriting earlier recordings use the safe **Record Function** (see **Manual Recording - Safe Record**).

In the Index Picture Screen you can select the point where you want to start your recording. Use the **STOP** (down up cursor) and **REVERSE** / **FORWARD** keys. You can see the current location on the slider bar, indicated by the arrow.

Your DVD recorder always checks the disc that you have inserted.

- ▶ When a DVD-RW/R disc is inserted on which recordings have been made, the Index Picture Screen is shown on your TV screen.
- ▶ If the inserted disc is a non-recordable disc, the message "NOT RECOR" appears on the display.
- ▶ If the inserted disc is a DVD-RW disc with a content that is not DVD-Video compatible (e.g. a data disc), a dialog box is shown with the option to erase or reject the disc. You can only record on this disc after erasing it with the **RECORD** key.

Notes:

- On a disc containing PA recordings, no NTSC recordings can be made and not even on an empty disc, either type of recordings can be made.
- No recordings can be made from recorded "Pre-Recorded" or PA, CG tracks.

- ▶ A disc that holds up to 48 titles (including empty titles). When this maximum is reached the on-screen message "Too many titles" appears. If you want to make a new recording, you have to erase a title first next to an empty title. (see "Managing Disc Contents")

Manual recording

Checking input

Normally, the DVD recorder displays the contents of the disc on screen.

- Press **MONITOR** in order to switch to the external tuner, or whichever other source is selected. If you want to check the input before starting a recording:
 - ▶ On the TV screen, you will see the actual picture quality that you will get if you record the video that has been encoded and decoded again. This is why you will see a delay of about 1.5 seconds when using a "live" source such as a camera.
- In monitor mode you can choose programme numbers directly with the digit keys 0-9 or the remote control.
- Press **SELECT** repeatedly to select the desired record mode.
- Press **MONITOR** again to go back to disc mode.

Recording

- Insert a recordable DVD-RW or DVD-R disc.
- Normally, the DVD recorder displays the contents of the disc on the screen.
- Use the **MONITOR** button to see the currently selected TV channel.
- Use **CHANNEL** / **CH** (on the remote control) to select the programme number (programme name) from which you want to record.
 - ▶ When a TV channel/channel's channel name it will be shown on the display.

The following programme numbers are provided for recording from external sources:

- EXT1: TV set via START + **ENTER**.
- EXT2: for recording from external sources via START + **ENTER**.
- EXT3: via 0-9 keys.
- EXT4: via **EXT**.
- GM1: from 5 wires (VCC).
- GM2: from 5 wires (GND).
- GM3: from 5 wires (VCC).
- GM4: from 5 wires (GND).
- Press **RECORD** (on the recorder) or **REC/OTR** (on the remote control):
 - ▶ **RECORD** is shown on the display.
 - ▶ The status box is shown on the screen for a few seconds.

- To bring back the status box during recording press **SYSTEM MENU**. Pressing **SYSTEM MENU** over and over will remove the status box again.
- Press **PAUSE** to pause recording. This can resume recording by pressing **PAUSE** once more. The DVD recorder will make a seamless connection.
- Press **STOP** to stop recording. Thus, are recording from a camcorder, watch the video output of the DVD recorder or the TV - instead of the camcorder viewer - to determine the right moment to stop.

- The Index Picture Screen is updated.
 - ▶ **RECORD** / **STOP** is shown on the display.
- After a short recording on a new DVD-RW disc, a few minutes will be needed to complete the formatting of the disc.

Safe Recording

When you start recording on a DVD-RW disc, by briefly pressing the **RECORD** or **REC/OTR** key, a recording on DVD-RW will be made from the current position of the disc pointer. To prevent this do the following:

- Hold the **RECORD** key (on the recorder) or **REC/OTR** key (on the remote control) press for about two seconds and **PAUSE** / **RECORD** appears on the display.
- The recorder automatically jumps to the end of the last title on the disc and starts recording.
 - ▶ If no free space is left, the display will show "FULL" (see 1.5. Safe record is not possible then).

Recordings on DVD-RW are always automatically made after the last title on the disc.

Direct Record

With Direct Record you can start recording immediately from the programme selected on the TV set.

- Make sure **Direct record** is selected "On". (See record settings).
- On the TV set, select the programme number you want make the recording from.
- Make sure the DVD recorder is switched to standby.
- Press **RECORD** (on the recorder) or **REC/OTR** (on the remote control).

Notes:

- Don't enter number (programme number) on your TV set, use the **TV** on the display of your DVD recorder. This can take up to few minutes.
- When "FULL" appears on the display, the programme number could not be found. The DVD recorder switches off automatically.
- If your headphones are connected (as an amplifier / receiver) to your DVD recorder, the sound will be delayed relative to the TV picture when watching directly from the TV set.
- You can use Direct Record in combination with Safe Record.

Manual audio control

You can control the audio recording level of your DVD recorder manually.

- In monitor mode, press **AUTO/MAN REC VOLUME** on the DVD recorder.
 - ▶ The display will show the current audio level and **MANUAL** appears.

- Adjust the recording level with **MANUAL**, **▲** or **▼** on the DVD recorder, so that the DVD mark lights up during the loudest parts of the recording.
- You can switch back to a normal audio level control by pressing **AUTOMAN REC VOLUME** again.
 - ▶ The display will show the current disc position and **MANUAL** disappears.

Note:

When DV input is selected, manual volume control is disabled.

Recording with automatic switch-off (QTR One-Touch Recording)

- Insert a **rewritable DVD-RW** or **DVD-R** disc.
- Use **CHANNEL ▲** or **CHANNEL ▼** (on the recorder) or **CH+**, **CH-** (on the remote control) to select the programme number (programme name) from which you wish to record.
- Press **RECORD** (on the recorder) or **REC.QTR** (on the remote control) twice.
 - ▶ A record up will be made of 30 minutes.
 - ▶ The recorded end time of the recording is shown in the timer box on screen. The remaining recording time is shown on the display.

- Press **RECORD** or **REC.QTR** again to obtain a 10 minute increment.
- Shortly after pressing **REC.QTR**, QTR can be cancelled by pressing **CLEAR**.

Timer programming

The DVD recorder needs the following information for every programmed recording:

- the date on which the recording is to be made;
- the channel;
- the start and stop time of the recording;
- **VCR/VIDEO** on or off;
- the recording mode.

The DVD recorder stores all the information mentioned above in a **timer block**. You can programme up to six timer blocks, one month in advance.

When you have programmed the timer, a red line on the disc list (both on the display and on the Index Picture Screen) indicates what part of the disc will be overwritten by the programmed recording from the current disc position (on DVD-RW) or from the last position (on DVD-R).

When all timer blocks are full, the options timer programming and **VIDEO Plus+** system cannot be accessed. For clearing a timer block, see "How to clear a timer block".

What is VCR/VIDEO?

With **VCR/VIDEO**, the TV screen controls the beginning and the length of the programmed recording. This means that the video recorder switches itself on and off at the right time, even if a TV programme you have programmed begins earlier or finishes later than expected. Usually the start time is the time in the **VCR/VIDEO** row. However, in the TV guide, in addition to a TV programme start time, a different **VCR/VIDEO** time is given, e.g. 20:15 (PFS 20:14), you must enter 20:14 as the start time exactly to the minute. If you wish to enter a time that differs from the **VCR/VIDEO** time, you must switch off **VCR/VIDEO**.

Timer programming with the VIDEO Plus+ system

A **PlusCode** number is a number of up to nine digits printed in most TV guides next to the start time of a TV programme.

All the information required for programming is encoded in the **PlusCode** number.

- Select **VIDEO Plus+** system with a (left cursor) or (right cursor).

- Press (right cursor).

- Enter the **video PlusCode** number (up to nine digits) printed in your TV guide next to the start time of a TV programme. If you made a mistake, you can correct it with **CLEAR**.
- Confirm with **OK**.
- If the **VIDEO Plus+** system does not recognise the TV channel, the message **Program number** will appear on screen. Select the required programme number (programme name) with (left right cursor) or the digit keys 0-9 and confirm with **OK**.

- ▶ The data will appear on the TV screen.
- Press (right cursor).
- Use **SELECT** to select the programming key at daily or weekly intervals. Select **Multi** for recording at daily intervals from Monday to Friday inclusive. Select an individual day of the week for recording at weekly intervals on the same day of the week.
- Press (right cursor).
- Use **SELECT** to switch **VCR/VIDEO** on or off.
 - ▶ When **VCR/VIDEO** is switched on, the start time is marked with an asterisk.
- Press (right cursor).
- Use **SELECT** to select the recording mode.

- Confirm with **OK**.
 - ▶ The data has been stored in a timer block.
- To end, press **TIMER**.
- Make sure that you inserted a recordable disc. If you inserted a write-protected disc, recording will be refused.
- Switch off with (standby).

Timer programming without the VIDEO Plus+ system

- Press **TIMER** on the remote control.
- Select **Timer programming** with (left cursor) or (down cursor).

- Press (right cursor).
- Enter the date with (left cursor) or (down cursor), or with the digit keys 0-9.

Playback

Playing a DVD+RW or DVD+R disc

- Insert a DVD+RW or DVD+R disc.
 - If the inserted disc is write-protected, playback starts automatically otherwise the Index Picture Screen appears.
- Press **PLAY**.
 - Playback starts automatically from the point where it was stopped the last time the disc was played or recorded. If you want to start playback from the beginning of the disc, you can do so via the Index Picture Screen (see "Index Picture Screen").
 - If the disc is a new blank disc, the display will show "100% 00:00".
- To stop playback at any time, press **STOP**.
 - This returns to the Index Picture Screen.

Playing a pre-recorded DVD-Video disc

Some DVD discs are produced in a way that requires specific operation or allows only limited operation during playback. In these cases the recorder may not respond to all operating commands. When this occurs, please refer to the instructions in the disc's tray. When a **T** appears on the TV screen, the operation is not permitted by the recorder or the disc.

- Insert a pre-recorded DVD-Video disc. Make sure the label is facing up. If the disc is two-sided, make sure the label of the side you want to play is facing up.
 - When "Automatic" is set to "ON" (see User Preferences), playback starts automatically from the point where it was stopped the last time the disc was played.
 - When "Automatic" is set to "OFF", the disc will play from the start of the disc. You can, however, resume play from the point at which you stopped, via the menu the disc was played, by pressing **PLAY** when **T** appears on screen.
 - The currently playing title and chapter numbers are displayed on the recorder display. The speed mode is shown as **SP**.

Note:

DVD movies can be released in different times in different regions of the world, with films from regions other than disc can have an optional region code. If you load a disc of a different region code to your recorder, you will see the region code notice on the screen. The disc will not play, and should be unloading.

The region code is stated on a label on the back side of your recorder. Regional coding is not applicable for recordable DVD discs.

- The disc may invite you to select an item from a menu. If the selections are numbered, press the appropriate numerical key; if not, use the **UP**, **DOWN**, **LEFT**, **RIGHT** cursor keys to highlight your selection, and press **OK**.
- To stop play at any time, press **STOP**.
 - The default screen will appear, giving information about the current status of the recorder.

Note:

During playback you can delete and enter the menu by pressing **DISC MENU**.

Playing a (Super) Video CD disc

- Insert a (Super) Video CD.
 - When "Automatic" is set to "ON" (see User Preferences), playback starts automatically from the point where it was stopped the last time the disc was played.
 - The disc may invite you to select an item from a menu. If the selections are numbered, press the appropriate numerical key **0-9**.
- To stop play at any time, press **STOP**.
 - The default screen will appear.

General features

Note:

When stated otherwise, all operations described are based on remote control operation. A number of operations can also be carried out on the system menu bar on the screen, just by using menu bar operation.

Moving to another title/track

When a disc has more than one title or track, you can move to another title or track as follows:

- Press **TITLE**.
- Press **▶ NEXT** during play to step forward to the next title.
- Press **◀ PREVIOUS** during play to return to the beginning of the current title. Rapidly press **◀ PREVIOUS** twice to step back to the previous title.
- To go directly to any title or track, enter the title number using the numerical keys **0-9**.

Note:

If the number has more than one digit, press the keys in rapid succession.
If the system menu bar is on screen, make sure the **T** icon is selected.

Moving to another chapter/scene

When a title on a disc has more than one chapter or a track has more than one index, you can move to another chapter/index as follows:

- Press **▶ NEXT** during play to select the next chapter/index.
- Press **◀ PREVIOUS** during play to return to the beginning of the current chapter/index. Rapidly press **◀ PREVIOUS** twice to step back to the previous chapter/index.
- To go directly to any chapter or index, enter the chapter or index number using the numerical keys **0-9**.

Note:

If the number has more than one digit, press the keys in rapid succession.
If the system menu bar is on screen, make sure the **C** icon is selected.

Slow Motion

- Select **1/4** (Slow motion) in the system menu bar.
- Use the **◀** (down cursor) key to enter the slow motion menu.
 - The recorder will now go into pause mode.

- Use the **◀** (left/right cursor) keys to select the required speed: **1/4**, **1/2**, **3/4** or **1.5** (backward); **1.5**, **1.4**, **1.2** or **1** (forward).
- Select **1** to play at normal speed again.
- If **PAUSE** is pressed, the speed will be set to **0**.
- Press **▶ PLAY** to exit slow motion mode.
- Press **◀** (up cursor) to delete the slow motion menu. You can also reset Slow Motion speeds by using the **▶ SLOW** key on the remote control.

Still Picture And Step Frame

- Select **Picture by picture** in the system menu bar.
- Use the **↓** (down cursor) key to enter the picture by picture menu.
- ▶ The recorder will now go into pause mode.

- Use **←** (left right cursor) keys to select previous or next picture.
- Press **▶ PLAY** to exit picture by picture mode.
- Press **↑** (up cursor) to exit the picture by picture menu.

To scan and step forward by using the **⏸ PAUSE** repeatedly on the remote control

Search

- Select **Time Search** in the system menu bar.
- Use the **↓** (down cursor) keys to enter the time search menu.

- Use the **←** (left right cursor) keys to select the required speed: **32**, **18** or **14** (backwards), **1**, **3**, **32** (forward).
 - Select **1** to play at normal speed again.
 - Press **▶ PLAY** to exit time search mode.
 - Press **↑** (up cursor) to return the last system menu.
- To search forward or backward through different speeds, you can also press **⏮ REVERSE** or **⏭ FORWARD** again.

Repeat

DVD Discs - Repeat chapter/scene

- To repeat the currently playing chapter, press **REPEAT**.
 - ▶ **Repeat** appears on screen.
- To repeat the currently playing title, press **REPEAT** a second time.
 - ▶ **Repeat** appears on screen.
- To repeat the entire disc, press **REPEAT** a third time.
 - ▶ **Repeat** appears on screen.
- To exit repeat mode, press **REPEAT** a fourth time.

Video CDs - Repeat track/disc

- To repeat the currently playing track, press **REPEAT**.
 - ▶ **Repeat** appears on screen.
- To repeat the entire disc, press **REPEAT** a second time.
 - ▶ **Repeat** appears on screen.
- To exit repeat mode, press **REPEAT** a third time.

Repeat A-B

To repeat or loop a sequence in a title

- Press **REPEAT A-B** at your chosen starting point.
 - ▶ **Repeat A-B** appears on screen.
- Press **REPEAT A-B** again at your chosen end point.
 - ▶ **Repeat A-B** repeat appears on screen, and the repeat sequence begins.
- To exit the sequence, press **REPEAT A-B**.

Scan

Press the first 10 seconds of each chapter/scene on the disc.

- Press **SCAN**.
- To continue play at your chosen chapter/scene, press **SCAN** again or press **▶ PLAY**.

Time search

The Time Search function allows you to start playing at any chosen time stamp.

- Select **Time Search** in the system menu bar.
- Press **↓** (down cursor).
 - ▶ The recorder will now go into pause mode.
 - ▶ A time entry box appears on the screen showing the displayed playing time of the current disc.

- Use the digit key **0-9** to enter the required start time (Enter hours, minutes and seconds in the box).
 - ▶ Each time an item has been entered, the next item will be highlighted.
- Press **OK** to confirm the start time.
 - ▶ The time entry box will disappear and play starts from the selected time position.

Zoom

The Zoom function allows you to enlarge the video image and to pan through the enlarged image.

- Select **Zoom** in the system menu bar.
- Press **↓** (down cursor) to activate the Zoom function and select the required zoom factor: **1**, **50** or **3** or **4**.
 - ▶ The recorder will go into pause mode.
 - ▶ The selected zoom factor appears below the Zoom icon in the system menu bar and **PAN** appears below the system menu bar.

- ▶ The picture will change in size and shift.
- Press **OK** to confirm the selection.
 - ▶ The panning icons appear on the screen.
- Use the **←** (left right cursor) and **OK**.
- Use the **↑** (up cursor) and **↓** (down cursor) keys to pan all over the picture.
- When **OK** is pressed only the zoomed picture will be shown on the screen.
- If you wish to return at any moment, press **↑** (Zoom) and select the required zoom factor as described above.
- Press **▶ PLAY** to exit zoom mode.

Special VCD features

Playback Control (PBC)

- Make sure **PBC** is switched **ON**. See "Live Performance features settings".
- Load a library video CD with **PBC** and press **▶PLAY**.
 - ▶ The **PBC** menu appears on screen.
 - ▶ Go through the items with the keys indicated on the screen and/or your chosen passage starts to play. If a **PBC** menu consists of a list of titles, you can select a title directly.
- Press your **Home** with the channel set to **00**.
- Press **RETURN** to go back to the previous menu.

Playing an audio CD

- ▶ After loading the disc, playback starts automatically.
- ▶ If the TV set is on, the Auto ECD system operates.
- ▶ During play, the current track number and its elapsed playing time will be shown in the screen and the recorder display.

radio 101.7fm

101.7 FM

101.7 101.7

101.7 101.7

- ▶ To stop play at any time, press **■ STOP**.
- ▶ The number of topics and the artist playing them will be shown on the screen and the recorder display.

If the data contains sequences recorded from different camera angles, the angle box appears, showing the number of available angles and the angle being shown. You can play through the camera angle if you wish.

- Use the Δ key to select the required angle in the angle box.
- To go to any angle directly, enter the angle number using the **numeric** keys, **0-9**.
 ► After a small delay, the page changes to the selected angle. The angle box remains displayed until next page. Angles are no longer available.

A diagram showing a horizontal line representing the optical axis. A double-headed arrow below the line is labeled f . A point on the left is labeled u .

- **Index** : Listed in the upper menu bar.
- **Process** : **AUDIO** as it is shown as a card repeatedly to step through the different languages.
- You can enter the regional language code by clicking on the numerical key **0-9**.

● Press **T.C.** to turn on by **DISC MENU**

- Press **T/C** to format by **DISC MENU**.

- To remove the disc menu, press **DISC MENU** again.

Pause

- Press **II PAUSE** during play.
- To return to play, press **▶ PLAY**.

Search

- To search forwards or backwards through the disc at 4x normal speed, press **↔ REVERSE** or **▶▶ FORWARD**.
▶ Search begins.
- To stop at 4x normal speed, press **↔ REVERSE** or **▶▶ FORWARD** again.
- To return to 4x normal speed, press **↔ REVERSE** or **▶▶ FORWARD** again.
- If the TV set is on, search speed and direction are indicated on the screen each time **↔ REVERSE** or **▶▶ FORWARD** is pressed.
- To end the search, press **▶ PLAY** or **■ STOP** as desired.

Moving to another track

- Press **▶ NEXT** during play to step forward to the next track.
- Press **◀ PREVIOUS** during play to return to the beginning of the current track. Rapidly press **◀ PREVIOUS** twice to step back to the previous track.
- To go directly to any track, enter the track number using the numerical keys 0-9.

Repeat track/Disc

- To repeat the currently playing track, press **REPEAT**.
▶ "Repeat track" appears on screen.
- To repeat the entire disc, press **REPEAT** a second time.
▶ "Repeat disc" appears on screen.
- To exit repeat mode, press **REPEAT** a third time.

Repeat A-B

- To repeat or loop a trackback:
● Press **REPEAT A-B** at your chosen starting point.
▶ "Repeat A" appears on screen.
- Press **REPEAT A-B** again at your chosen end point.
▶ "Repeat A-B" appears on the display and the repeat sequence begins.
- To exit the sequence, press **REPEAT A-B** again.

Scan

- Play the first 30 seconds of each track on the disc.
- Press **SCAN**.
- To continue play at your chosen track, press **SCAN** again or press **▶ PLAY**.

Playing an MP3 disc

The DVD Recorder can play MP3 CDs that comply with the following constraints:

- File system: ISO9660
- Maximum: 31 characters
- Maximum: 8 levels of nested directories
- Maximum: 32 albums
- If tagbits variable bit rates, including 32, 48, 56, 64, 80, 96, and 128 kbps, and sampling rates of 32 kHz, 44.1 kHz and 48 kHz. (If a multi-session disc, only the first session will be played.)

The following formats are not supported:

- File with extensions: *WMA, *AAC, *FLAC, *MIDI, *PLS
- Chinese filenames
- Discs of which the session is not closed
- Discs recorded with the UDF file system.

Downloading MP3 files from the Internet or copying songs from your own discs is a delicate process.

Track	Quality (kb/s)	Duration (min)	Maximum data rate (kb/s)	Comments
1	128	3:30	128	128 kbps, 44.1 kHz
2	128	3:30	128	128 kbps, 44.1 kHz

28	128	3:30	128	128 kbps, 44.1 kHz
29	128	3:30	128	128 kbps, 44.1 kHz
30	128	3:30	128	128 kbps, 44.1 kHz

Notes

You may experience an occasional "skip" while listening to your MP3 files.
The disc reading time may exceed 15 seconds due to the large number of songs compiled onto one disc.
In compliance with the DDM, the digital output is muted while playing MP3 discs.
Due to the recording nature of Digital Audio (MP3/DAM), only Digital Audio music will play.

Play

- From the disc:
▶ After loading the disc, playback starts automatically.
If the TV set is on, the MP3 screen appears.
During play, the current album and track number and its elapsed playing time will be shown on the screen and the recorder display. On screen, also the name of the album, the track and the artist are shown.

- To stop play at any time, press **■ STOP**.
▶ The number of albums will be shown on the screen and the recorder display.

Pause

- Press **II PAUSE** during play.
- To return to play, press **▶ PLAY**.

Moving to another album/track

- In play mode you can use the **◀ PREVIOUS** or **▶ NEXT** keys and the numerical keys 0-9 to select a specific track.
- In stop mode you can use the numerical keys 0-9 to select a specific album.
- To select another album while in play mode, press **TIC** to select the "T" icon on the system menu bar. You can then move to another album with the screen "T" or the numerical keys 0-9.

Repeat Album/Track/Disc

- To repeat a track, press **REPEAT**.
▶ "Repeat track" appears on the screen.
- To repeat an album, press **REPEAT** a second time.
▶ "Repeat album" appears on the screen.
- To repeat the entire disc, press **REPEAT** a third time.
▶ "Repeat disc" appears on the screen.
- To exit **REPEAT** mode, press **REPEAT** a fourth time.
▶ "Repeat off" appears on the screen.

Access control

Child Lock (DVD and VCD)

When activating Child lock, only discs that are authorized can be played without PIN code.

The recorder memory maintains a list of 50 authorized (Child safe) disc titles. A disc will be placed in the list when "Play Always" is selected in the "Child protect" dialog. Each time a "Child safe" disc is played it will be placed on top of the list. When the list is full and a new disc is added the least recently used will be removed from the list.

Activating/deactivating the child lock

- Select **Access control** in the features menu, using **Up** (down up cursor) and press **Enter** (right cursor).

- Enter a 4-digit PIN code of your own choice using the digit keys **0-9**.
- Enter the code a second time.
- Move to **Child lock** using **Up** (down up cursor).
- Move to **Off** (using the left/right cursor) key.

1 ACCESS CONTROL

- Select **Off** using **Left** (down up cursor).
- Press **OK** or **Enter** (right cursor) to confirm and press **SYSTEM MENU** again to exit the menu.
- Note: Unauthorized discs will not be played unless the 4-digit code is entered.
- Select **On** to deactivate the Child Lock.

Note:

Reconfiguration of the 4-digit PIN code is possible when the code is entered for the very first time (see above). The code is changed (see "Changing the 4-digit code"). The code is cancelled (see "Changing the 4-digit code"). Back Child lock and Parental Control are switched **Off** and the code is requested.

Authorizing discs when Child Lock is activated

- Insert the disc.
 - The "Child protect" dialog will appear. You will be asked to enter your secret code for "Play until" or "Play always". If you select "Play until", the disc can be played as long as it is in the recorder and the recorder is in the **On** position. If you select "Play always", the disc will become "Child safe" (authorized) and can always be played even if the Child lock is set to **On**.

Note:

Double-sided DVD discs may have a different ID for each side. In order to make the disc "Child safe", each side has to be authorized.

Multi-volume VCD discs may have a different ID for each volume. In order to make the complete set "Child safe", each volume has to be authorized.

Securing discs

- Insert the disc.
 - Playback starts automatically.
- Press **STOP** while **On** is visible.
 - On** will appear and the disc is now banned for its own "Child safe" rating.

Parental Level (DVD-Video only)

However, pre-recorded DVD discs may contain scenes not suitable for children. Therefore discs may contain "Parental Control" information which applies to the complete disc or to certain scenes on the disc.

These scenes are rated from 1 to 8 and therefore, more suitable scenes are available to the disc. Ratings are country dependent. The Parental Control feature allows you to prevent discs from being played by your children, or to have certain discs played with alternative scenes.

Activating/Deactivating Parental Control

- Select **Access control** in the features menu using **Up** (down up cursor) and press **Enter** (right cursor).
- Enter your 4-digit PIN code using the digit keys **0-9**. If necessary enter the code a second time.
- Move to **Parental level** using **Up** (down up cursor).
- Move to the Value Adjustment bar using **Left** (right cursor) key.

- Use the **Up** (down up cursor) keys on the numerical keys **0-9** on the remote control to select a rating from 1 to 8 for the disc inserted.

A rating 9 is displayed as **Unrated**.

Parental Control is not activated. The disc will be played as Us.

A rating 1 to 8 is **Childsafe** - 8 is adults only.

The disc contains scenes not suitable for children. If you set a rating for the recorder, all scenes with the same rating or lower will be played. Higher rated scenes will not be played unless an alternative is available on the disc. The alternative may have the same rating or a lower one. If no suitable alternative is found, play will stop and the 4-digit code has to be entered.

- Press **OK** or **Enter** (right cursor) to confirm and press **SYSTEM MENU** again to exit the menu.

Country

- Select **Access control** in the features menu using **Up** (down up cursor) and press **Enter** (right cursor).
- Enter the four digit PIN code.
- Move to **Change country** using **Up** (down up cursor).
- Press **Enter** (right cursor).

- Select a country using **Up** (down up cursor).
- Press **OK** or **Enter** (right cursor) to confirm and press **SYSTEM MENU** again to exit the menu.

Changing the 4-digit code

- Select **Access control** in the Features menu using **5** (shown up cursor) and press **3** (right cursor).
- Enter the gold code.
- Move the **Change code** using **2** (shown cursor)

- Press **D** (right cursor)
- Enter the new 4-digit PIN code.
- Enter the code a second time and reconfirm with **OK**.
- Press **SYSTEM MENU** to exit the menu.

2000-2001

If you forget your code, press **■STOP** four times while in the master control PRS code box and exit with **OK**. Access control is now switched off for 300 days, using a *time code* as described above.

Managing disc content

Title settings

For each title on a DVD-ROM or DVD-R disc the default settings can be changed to your personal preferences in the title playback menu.

Changing the title name

- In the Index Picture Screen, select the required title with Δ (arrow up cursor).
- Press \rightarrow (right cursor) to enter the film settings menu.

- Press **C** to **right cursor**.
- Press the **new char** **A** charmap contains a maximum of 54 characters.
- Use **20** **left** **right** **cursor** for the position of the character. Use **20** **down** **up** **cursor** to change character.
- Use **SELECT** to toggle between capital and lower case character.
- Use **CLEAR** to erase a character.
- Confirm for **proceed** **OK**.

[Play full text](#)

- In the Index Picture Screen, select the required title with **↑/↓** button as shown.
- Press **5** (right corner) to enter the title settings menu.
- Select **Play and title**.

When you start to record the time well be played in Kili, including hidden chapters. Follow the instructions on the screen. (Now changing the current "Favorite Scene Selection")

Erasing a title

You may simply erase a title on CUBES-82W by recording over it, but if you want to erase the whole title initially do the following:

- In the Index Picture Screen, select the required title with the arrow up/down.
- Press **ENTER** several times until the title settings menu.
- Select **Erase this title**
 - The message "This will completely erase this title. Press OK to continue" is shown.

- ▶ **Freeing time** If a streamer used the feature is completed
- ▶ After the info has been entered, the Video Picture Screen will show an empty space instead. If there was an empty space in front of the label *Free time*, then there are *condemned* (by law) empty space. Empty spaces of less than one minute will not be shown.

On EFD-98, tubes can also be stored but the space occupied cannot be used anymore. During distribution, empty tubes are removed from the ledger. **Barcode System**

Disc Info Screen

- When on the Index Picture Screen, press **■STOP**.
 - ▶ You are now on Title 1.
- Press **◀** (left cursor).
 - ▶ You are at the User Info Screen.
- Press **▶** (right cursor) to exit the User Info Screen.

The Disc Info Screen contains the following information:

Disc Settings

For each DVD-RW or DVD+RW disc the settings can be changed to your personal preference in the disc settings menu.

- In the Disc Info Screen press **2** (right cursor).
 - You will now enter the 'disc settings' menu.

Changing the Disc Name

- In the Disc Info Screen press **2** (right cursor).
 - You will now enter the 'disc settings' menu.

- Press **2** (right cursor).
- Enter the new name. A name may contain a maximum of 64 characters.
- Use **12** (left right cursor) for the position of the characters. Use **2** (down up cursor) to change characters.
- Use **SELECT** to toggle between capital and lower case characters.
- Use **CLEAR** to erase a character.
- Confirm by pressing **OK**.

Protection of recordings

- In the Disc Info Screen press **2** (right cursor).
 - You will now enter the disc settings menu.
- Select **Protection** and press **2** (right cursor).
- Select **Protected** with **2** (down up cursor).
- Press **OK** on the remote control to confirm.
 - No further changes can be made to the disc. It will also disable most playback settings options as well as any complete edit mode.
 - Future editing is only possible after restoring the Protection feature to **Unprotected** again.

Erasing a disc

This option is only available for DVD+RW discs that are not erase-protected.

- In the Disc Info Screen press **2** (right cursor).
 - You will now enter the disc settings menu.
- Select **Format disc** with **2** (down up cursor).
 - The message **This will erase all data** is displayed.

- Press **OK** to confirm or **2** (left cursor) to cancel.
 - **Erasing disc** is shown until the action is completed.
 - After the disc has been erased, the Index Picture Screen will show the free space on the disc.

Finalising a DVD+R disc

While a DVD+RW disc can be played instantly on most DVD players, a DVD+R disc can be played only on the DVD recorder until it is **finalised**. After finalisation no changes can be made to the disc anymore.

- In the Disc Info Screen press **2** (right cursor).
 - You will now enter the 'disc settings' menu.

- Select **Finalise disc** and press **OK** to confirm.
 - **Finalising** is shown until the action is completed.
 - After finalisation the Index Picture Screen will appear.

If the DVD+R disc was recorded on a different brand of DVD recorder you may not be able to access the Disc Settings screen. In this case you can use the **Finalise DVD** option in the Feature menu of the user preferences menu.

Making your edits DVD-compatible

If one or more titles have been edited (see Favourite Scene Selection), then the edits will play on your DVD recorder, but a DVD player may show the original version instead of the edits. You can prepare your DVD+RW discs so that also a DVD player will show the edited version. This is not possible with DVD+R discs.

- If the Disc Settings menu shows the option **Make edits DVD compatible**, select the option. If the menu does not show this option, then your DVD+RW disc is already compatible and no conversion is needed.

- Press **OK** on the remote control to confirm.
 - The message **This will take 1** and **Press OK** to confirm will appear to indicate how long the action will take.
- Press **OK** on the remote control to confirm.
 - **Processing** and a progress bar are shown until the action is completed.

Favourite Scene Selection

The basic function of any edit operation is to improve a usability and finding of your recordings. For instance, scenes you do not want to see during playback (eg. commercials during a movie) can be marked as chapters and made hidden. During playback you will skip your recording without the hidden chapters as new sequences.

Also, in between the scenes the picture may freeze for a short moment.

Each title consists of chapters. With the FSS menu any chapter can be made hidden or made visible again. Normally, during recording, chapter markers are inserted automatically every five to six minutes. If a setting can be changed in the record settings menu. After the recording is finished, you can manually add and remove chapter markers via the FSS menu. Automatically generated and manually selected chapter markers can be removed.

After editing, the modified version of a title is the default playback version. The original can be accessed via the **Play full title** option in the title settings menu. Other DVD players may still play the original. To guarantee that the edited version will play on these DVD players, choose **Make edits DVD-compatible** in the disc settings menu (only available on DVD+RW discs).

Calling up the FSS menu

- Play the title you want to edit.
- Press the **FSS** key on the remote control.
 - The video image is overlaid with a transparent edit menu. Title and chapter information appear in an information box at the top of the screen.

Also, the Favourite Scene Selection menu will disappear after about five minutes. If you do not edit any information.

- Use **2** or **1** (down up cursor) to toggle through the menu's functions.

MANAGING DISC CONTENT 47

Inserting chapter markers

- In play mode press **⏮ FSS** on the remote control to call up the FSS menu.
- Select **Insert chapter marker**.
- Press **OK** on the remote control to insert a marker.

The maximum number of chapter markers is 99. When the maximum is reached the on screen message "Too many chapters" appears. You have to delete some before inserting new chapter markers.

During recording you can add chapter markers by pressing **⏮ FSS** on the remote control. The message **Chapter marker inserted** will appear on the screen.

Hiding chapters

Initially all chapters are visible. You can hide chapters or make them visible again on playback. In FSS mode however hidden chapters are displayed in a dimmed mode.

- In play mode press **⏮ FSS** on the remote control to call up the FSS menu.

- Select "Current chapter" with the **↑** or **↓** (down/up) cursor.
- Select **Visible** or **Hidden** with the **→** (right) cursor key.
- You can toggle between **Visible** and **Hidden** directly from any line in the FSS menu with the **SELECT** key on the remote control.

Deleting chapter markers

You can combine a chapter with the previous chapter in the current title by deleting the chapter at the beginning of the current chapter.

- In play mode press **⏮ FSS** on the remote control to call up the FSS menu.
- Select **Delete chapter marker**.
- Press **OK** on the remote control to confirm.
- **Delete marker** will appear.

You can delete all chapter markers (initially not automatically generated) in the current title.

- In play mode press **⏮ FSS** on the remote control to call up the FSS menu.
- Select **Delete chapter markers**.
- Press **OK** on the remote control to confirm.
- The message "This will delete all markers in this title" will appear.
- Press **OK** on the remote control to confirm.
- **Delete markers** will appear.

Changing the index picture

You can define the current video frame as a reference picture to be used for this title's menu in the Index Picture Screen.

- In play mode press **⏮ FSS** on the remote control to call up the FSS menu.
- Select **How index picture**.
- You can use **PAUSE** and/or **SLOW** to accurately choose the desired picture.
- Press **OK** on the remote control to confirm.
- The message "This will update the index picture" will appear.
- Press **OK** on the remote control to confirm.
- **Updating menu** will appear.

Dividing a title

On a DVD-RW disc you split one title into two separate titles. (On DVD-R disc it is not possible.)

- On the Index Picture Screen, select the title you want to divide.
- Press **▶ PLAY**.
- Go to the point where you want to divide the title and once **PAUSE**.
- Press **⏮ FSS**.
- The Favorite Screen Selection menu is shown.
- Select **[Divide title]**.

- Press **OK** on the remote control to confirm.
- **Dividing title** is shown until the action is completed. The divide operation cannot be undone.

The Index Picture Screen with these two titles instead of one. Both will have the same name. If you want to change the name, you can do so in the title settings menu. For one of the two resulting titles, a new index picture is created.

If you want to divide one title into more than two titles, use the above procedure several times.

Append recording

This function is only available on DVD+RW discs.

If you want to append a video recording to an earlier recorded title use the following:

- On the Index Picture Screen, select the title to which you want to add a video recording.
- Press **▶ PLAY**.
- At the point where you want to append the title press **PAUSE**.
- To monitor the video input you may press **MONITOR**.
- Press **RECORD** (on the recorder) or **REC+TRK** (on the remote control).

The video recording will now be appended from this point. Video material beyond this point is overwritten. This may include titles following the current title.

Any remaining video material that is not overwritten, which may include the last part of the original title, is maintained. You can access these titles from the Index Picture Screen.

Troubleshooting

If it appears that the DVD recorder is faulty, first consult the checklist. It may be that something has been overlooked. Under no circumstances attempt to repair the system yourself. This will invalidate the warranty. Look for the specific symptom(s). Then perform only the actions listed to remedy the specific symptom(s).

Symptom	Remedy
The recorder does not respond to the remote control	<ul style="list-style-type: none"> The remote control may be configured for a second DVD recorder. Hold SELECT+1 pressed simultaneously to revert to DVD recorder 1. Aim the remote control directly at the sensor on the front of the recorder. Avoid all obstacles which may interfere with the signal path. Inspect or replace the batteries.
Keys on the DVD recorder do not work	<ul style="list-style-type: none"> The DVD recorder may still be in Virgin mode. See First time set-up virgin mode. Otherwise (disconnect and reconnect the DVD recorder from the mains). If this does not solve the problem, check if the remote control is working. If so, the recorder is probably in trade mode. Disconnect the recorder from the mains and reconnect it while holding ■ OPEN/CLOSE and ■ STOP pressed.
No picture	<ul style="list-style-type: none"> Check if the TV set is switched on. Check the video connection. When the DVD recorder is connected to the TV set via video, you may not see the picture of the DVD recorder after sending the correct programme number on your TV set when a timer recording takes place. This is why you can still view another device (e.g. a cable or receiver).
Distorted picture, distorted sound	<ul style="list-style-type: none"> Check the disc for fingerprints and clean with a soft cloth, wiping from centre to edge. Sometimes a small amount of picture distortion may appear. This is not a malfunction.
Recorder does not play disc	<ul style="list-style-type: none"> Ensure the disc label is upwards and that the right disc type is inserted. Clean the disc. Check if the disc is defective by trying another disc. Check if the region code of the disc matches the region code of the recorder. (pre-recorded DVD discs only). See 'playing a pre-recorded DVD-Video disc'. Check if Child Lock is activated.
Distorted sound from HiFi amplifier	<ul style="list-style-type: none"> Check to make sure that the audio connection line leads to amplifier phono input. Check to make sure that analogue input of the amplifier is not connected to the digital output of the DVD recorder.
Distorted or black and white picture with DVD or Video CD disc	<ul style="list-style-type: none"> The disc format is not according to the TV set used (HBM/FSC).
No audio at digital output	<ul style="list-style-type: none"> Check the digital connection. Check the settings menu to make sure that the digital output is set to on. Check if the audio format of the selected audio language matches your receiver capabilities.
Recorder does not respond to all operating commands during playback of a DVD-Video disc	<ul style="list-style-type: none"> Some operations are not permitted by the disc. Refer to the instructions in the disc tray.

The recorder does not record timer programme

No new title can be recorded

Service codes on the display

Disc warning message on screen

Disc error message on screen

Disc errors

Two languages are 'mixed' when recording from a stereo VCR

The disc cannot be erased because the Index Picture Screen does not appear

The Index Picture Screen does not appear but the titles on the disc can still be played

A DVD player shows the Index Picture Screen but does not react to the **▶ PLAY** key

Make sure that the recorder is switched to standby before the timer starts.

Check if the maximum number of titles has been reached (message: **Too many titles**) on screen. If so, delete a title next to a free space.
Check if the disc is write protected. If so, unlock the disc in the disc settings menu (message: **DPS Lock**) on screen.
Check if the DVD-R disc has been formatted. If so, no new titles can be recorded anymore.

Clear the disc. The recording was most probably done correctly.

A write error has occurred, but it could be corrected. No user action is required.

A write error has occurred from which the recorder could not recover. Inspect the disc and clean it if necessary (refer to Introduction: Cleaning disc) for cleaning instructions). Record (overwrite) again over the same part of the disc to see if the problem is solved.

A disc might be corrupted because of dust, scratches or fingerprints. If the disc cannot be accessed anymore, use the backup disc erase procedure to repair it. Proceed as follows:
1. Clean the disc.
2. Put disc in the drawer. Do not close the tray.
3. Press and hold **CLEAR** for several seconds until the tray closes.

When the TV set does not automatically detect the dual-language signal (see left/right audio balance on the TV set) to empty the one or the other language.

1. Open drawer while having the disc in.
2. Hold **CLEAR** pressed for around 5 seconds until the tray opens. The disc is successfully not yet erased but you can start a new recording like on a blank disc.

Format the disc. Clean the disc. Insert the disc. Choose 'Adapt to own disc format' (see User Preferences - Features).

Press **■ STOP** to exit the Index Picture Screen, then press **▶ PLAY**.

▲ DVD+RW disc does not play on a certain DVD player

- There are DVD Players that will not play recordings made with a DVD Recorder. With a special procedure the recording will solve this problem for some players. Proceed as follows:
1. Put the disc in the drawer (do not close the tray)
2. Press and hold the **E** key on the remote control for several seconds until the tray closes. The disc is now recorded.
3. If the change has no effect, you may perform the same procedure with the **E** key on the remote control.

Note

Modifying the disc can solve the problem for a specific player model, but playback in other DVD players may no longer be possible. It is therefore recommended to use this procedure carefully and only when needed.

- To revert the disc to its original state, follow the same procedure with the **E** key on the remote control.

Note

To achieve maximum compatibility, make sure the disc crosses at least 5 minutes recorded in HQ mode, 10 minutes in HQ, 12 minutes in SP, 15 minutes in LP, 10 minutes in LP or 10 minutes in EP mode. For more information about compatibility with DVD players refer to "Troubleshooting" in the instructions for use.

Diagnosis programme

If the recorder is still faulty you can start the Diagnosis Programme in the recorder.

You can operate the Diagnosis Programme by following the instructions step by step.

Instructions

- 1. Unplug the power cord of the recorder.
- 2. Press the **PLAY** key and keep it pressed while you plug the recorder.
 - On the display the message "000" appears together with a counter. This counter indicates the termination of the test when zero is reached.
 - After a test is made the message on the local display changes over from "000" to "001" or to "002".
 - If the message "001" appears on the display, there is apparently a failure in your recorder and your recorder should be repaired.
- 3. Contact your dealer or the Philips Customer Care Centre for the nearest Service Repair Shop in your country. The phone number is given in your warranty booklet.
- 4. If the message "002" appears on the display, there is apparently no failure in your recorder, in this case the failure may be caused by incorrect interpretation of the operating instructions or a wrong disc is used or your recorder is not correctly connected. In this case you should consult your dealer or the Philips Customer Care Centre for further assistance in solving the problem.
- 5. If the problem remains, then consult your Philips Customer Care Centre.

System limitations

DVD+RW and DVD+R discs may not play on certain DVD Video players.

A DVD+RW video disc that has been recorded on a different type or brand of recorder can be played, but may not provide all features commonly available to DVD+RW discs, such as the on-screen disc title, the disc settings menu, the title settings menu, and editing. Refer to "Adapt disc format" if the disc is write-protected, the data cannot be changed.

When using manual recording, the DVD recorder will warn before adjusting the format of the disc or removing non-video data. When using timer recording however, the DVD recorder will always start to record, when the disc is write-protected. Movies, still and other data recorded on a different device (e.g. a PC) may be lost.

Because of the Variable Bit Rate, a title may take up less or more space than the prewritten title, even though the duration is the same. As a result, a part of the original title may be lost as a part of the next title may be lost. The maximum variation is five minutes.

After a power interruption during recording, the Index Picture Screen will not match with the actual video content on the disc. The last recorded title may be lost.

Glossary

This section explains most important terms, abbreviations, and acronyms used in this document.

Term	Explanation
AC-3	Audio Coding 3, also known as Dolby Digital. Multi-channel digital audio compression system from Dolby Labs.
AV	Audio/Video
Chapter	A part of a title.
Disc Bar	A graphical representation of the contents of a (DVD-RW) disc.
Disc Pointer	An arrow indicating the current playback/recording position on the DVD-RW disc, displayed on the disc bar.
DTS	Digital Theater Systems. A high-end Multi-channel audio compression format.
DV	Digital Video. A camcorder format for high-quality video, different from MPEG. It is converted into MPEG-2 Video when recorded on DVD-RW.
DVD	Digital Versatile Disc
DVD-R	DVD-Recordable. The write-once disc standard used by the DVD recorder.
DVD-RW	DVD-Recordable. One of the disc standards used by the DVD recorder.
EuroLink	If your TV set and your video recorder are equipped with this feature, they can exchange information to adjust certain settings to each other, such as the TV channel order and other user preferences.
FSS	Favorite Scene Selection, (see "Managing disc content").
LINK	Also known as FireWire and IEEE 1394. A cable for transfer of high bandwidth digital signals, as used by Digital Video camcorders.
Index Picture Screen	A screen that gives an overview of a DVD-RW disc, with Index pictures that each represent a recording.
MPEG	Motion Picture Experts Group. A collection of compression systems for digital audio and video.
MuxTV-in Link	A system that enables easy programming of a video recorder via a TV set. Also see SimpleLink.
NOCAM	System for reception of digital stereo TV sound.
NTSC	See TV system.
OSD	On-Screen Display. The user interface by which you can control the DVD recorder via the TV screen.
OTR	One-Touch Recording. With this feature you can easily start a recording by pushing just one button, and select one touch-off time in intervals of 30 minutes.

PAL	See TV system.
PGC	Playback Control. A special feature of a VCD, LDD or Super VCD disc that enables interactive use.
PCM	Pulse Code Modulation. A digital audio encoding system.
PDC	Progress Delivery Control.
RGB	Red-Green-Blue. A top-quality video connection where red, green and blue components of a video signal are carried through separate wires.
SCART cable	Also known as Euro AV cable. This standard cable is an easy way to connect various AV devices and televisions. In addition to audio and video it can carry control signals.
SECAM	See TV system.
S-video	Sometimes also called S-VHS or Super-VHS. A high-quality video connection standard.
SVCD	Super Video Compact Disc.
Title	It is the name given to the unit of recording on the disc. A title typically represents one recording.
TrueStereo	A system for simulating multi-channel sound reproduction via a two-channel set up by SRS Logic 7.
TV system	There are various systems for transmitting television signals, for example PAL, PAL+, PAL NG, SECAM, SECAM-DK, MUSE, etc. The TV system is country dependent.
VCD	Video Compact Disc.
VCR	Video Cassette Recorder.
VIDEO Plus+	A system by which you can easily program a time recording by entering a six digit PlusCode number found next to the programme descriptions in most TV guides.
VPS	Video Programming System.

Using your DVD recorder remote control with your TV set

First DVD recorder remote control can be used to control your TV set. The following steps will show you how to use the TV set.

1. Press the **POWER** button on the DVD recorder remote control. The TV set will turn on.

Some other steps normally control the DVD recorder, but will operate the TV set when you keep the button on the side of the remote control pressed.

2. Press the **POWER** button on the DVD recorder remote control. The TV set will turn on.

4. Mechanical Instructions

4.1 Service Positions

4.1.1 Front

Front

Figure 4-1

4.1.2 DVIO board

To put the DVIO board in a service position, an extender board must be used. This extender board can be ordered with codenumber 3104 128 07770.

DVIO Extender

Figure 4-2

DVIO 1

Figure 4-3

DVIO 2

Figure 4-4

4.1.3 Digital board

After demounting of DVIO board, the top side of the digital board is in reach. To reach the bottom side of the digital board, the DVDR module must be demounted together with the digital board. Connected to each other, the assembly can be set in a service position. In this position, the bottom side of the digital board and the servo board are in reach to be serviced.

Digital 1

Figure 4-5

Digital 2

Figure 4-6

4.1.4 Analog board

To put the analog board in service position, demount the assembly of analog board and backplate as follows:

1. Remove 3 screws from the backplate to the frame
2. Remove the screw from the backplate to the mains inlet of the power supply
3. Remove the screw of the analog board to the frame
4. Release the snaps of the 4 spacers of the analog board to the frame.

Turn the assembly of the backplate and the analog board against the loader.

5. Diagnostic Software and Faultfinding Trees

Due to the complexity of the DVD recorder, the time to find a defect in the recorder can become long. To reduce this time, the recorder has been equipped with Diagnostic and Service software (DS). The DS offers functionality to diagnose the DVDR hardware and tests the following:

- Interconnections between components
- Accessibility of components
- Functionality of the audio and video paths

This functionality can be accessed via several interfaces:

1. End user/Dealer script interface
2. Player script interface
3. Menu and command interface

5.1 End User/Dealer Script Interface

5.1.1 Description

The End user/Dealer script interface gives a diagnosis on a stand alone DVD recorder; no other equipment is needed. During this mode, a number of hardware tests (nuclei) are automatically executed to check if the recorder is faulty. The diagnosis is simply a "fail" or "pass" message. If the message "FAIL" appears on the display, there is apparently a failure in the recorder. If the message "PASS" appears, the nuclei in this mode have been executed successfully. There can be still a failure in the recorder because the nuclei in this mode don't cover the complete functionality of the recorder.

5.1.2 Contents

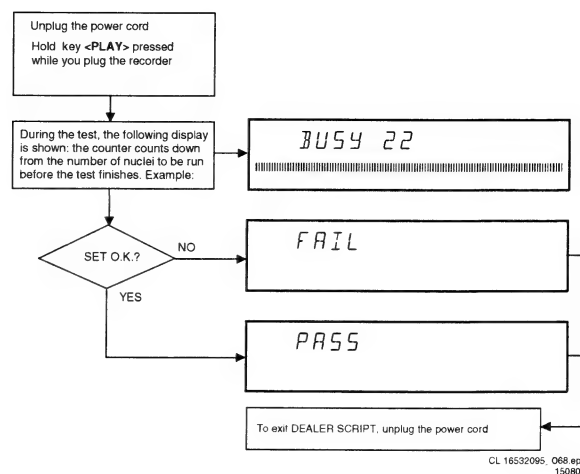

Figure 5-1

The End use/Dealer script executes all diagnostic nuclei that do not need any user interaction and are meaningful on a standalone DVD recorder. The nuclei called in the End user/Dealer script are the following:

Counter	Nucleus	Name	Description
22	104	HostdSdramWrR	checks all memory locations of the 4MB SDRAM
21	106	HostdDramWrR	checks all the DRAM connected to the microprocessor of the digital board
20	123	Hostdl2cNvram	checks the data line (SDA) and the clock line (SCL) of the I2C bus between the host decoder and NVRAM
19	202	SAA7118I2c	checks the interface between the Host I2C controller and the AVENC SAA7118 Video Input Processor
18	200	VideoEncI2c	checks the interface between the host I2C controller and Empress SAA6752
17	207	AudioEncI2c	checks the I2C connection between the host decoder and Empress SAA6752
16	204	AudioEncAccess	tests the HIO8 interface lines between the host decoder and the audio encoder
15	203	AudioEncSramAccess	checks the access of the SRAM by the audio encoder (address and data lines).
14	205	AudioEncSramWrR	tests the SRAM connected to the audio encoder
13	206	AudioEncInterrupt	tests the interrupt line between the host decoder and the audio encoder
12	300	VsmAccess	checks whether the VSM interrupt controllers and DRAM are accessible
11	303	VsmInterrupt	checks both interrupt lines between the VSM and the host decoder
10	302	VsmSdramWrR	tests the entire SDRAM of the VSM
9	1400	Clock11_289MHz	switches the A_CLK of the micro clock to 11.2896 MHz
8	1401	Clock12_288MHz	switches the A_CLK of the micro clock to 12.288 MHz
7	601	BeS2Bengine	checks the S2B interface with the Basic Engine by sending an echo command
6	500	DisplayEcho	checks the interface between the host processor and the slave processor on the display board
5	700	AnalogueEcho	checks the interface between the host processor and the microprocessor on the analogue board
4	711	AnalogueNvram	checks the NVRAM on the analogue board
3	706	AnalogueTuner	checks whether the tuner on the analogue board is accessible
2	901	LoopAudioUserDealer	This nucleus tests the components on the audio signal path - The analogue board - The audio encoder - The VSM On the analogue board the audio is internally looped back to the digital board
1	906	LoopVideoUserDealer	Nucleus for testing the components on the video signal system path: - The VIP - The video encoder - The VSM - The host decoder - The analogue board On the analogue the video signal is internally routed back to the digital board.

5.2 Player Script Interface

5.2.2 Structure of the Player Script

5.2.1 Description

The Player script will give the opportunity to perform a test that will determine which of the DVD recorder's modules are faulty, to read the error log and to perform an endurance loop test. To successfully perform the tests, the DVD recorder must be connected to a TV set.

To be able to check results of certain nuclei, the player script expects some interaction of the user (i.e. to approve a test picture or a test sound). Some nuclei (e.g. nuclei that test functionality of the DVDR module) require that a DVD+RW disc is inserted.

Only tests within the scope of the diagnostic software will be executed hence only faults within this scope can be detected.

The player script consists of a set of nuclei testing the hardware modules in the DVD recorder: the Display PWB, the Digital PWB, the Analogue In/Out PWB and the DVDR module. Nuclei run by the player test need some user interaction; in the next table this interaction is described. The player test is done in two phases:

- Interactive tests: this part of the player test depends strongly on user interaction and input to determine nucleus results and to progress through the full test. Reading the error log information can be useful to determine any errors that occurred recently during normal operation of the DVD player.
- The loop test will perform the same nuclei as the dealer test, but it will loop through the list of nuclei indefinitely.

STEP	DESCRIPTION	NUCLEUS
1	Press OPEN/CLOSE and PLAY at the same time and POWER ON the recorder to start the playerscript	2
2	The local display shows FPSEGMENTS . Press PLAY to start the test. First the <i>starburst pattern</i> is lit, then the <i>horizontal segments</i> are lit, followed by the <i>vertical segments</i> and the last test is <i>light all segments</i> test. After each of the 4 tests the user has to confirm that the correct pattern was lit. Press PLAY to confirm that the correct pattern was lit (four times if the FPSEGMENTS test was successful). Press RECORD to indicate that the correct pattern was not successfully lit. Press STOP to skip this nucleus.	502
3	The local display shows FPLABELS . Press PLAY to start the test. Press PLAY to confirm that all labels are lit. Press RECORD to indicate that not all labels are lit. Press STOP to skip this nucleus.	503
4	The local display shows FPLIGHT ALL . Press PLAY to start the test. Press PLAY to confirm that everything was lit. Press RECORD to indicate that not all patterns are lit. Press STOP to skip this nucleus.	520
5	The local display shows FPLED . Press PLAY to start the test. Press PLAY to confirm that the led is lit. Press RECORD to indicate that the led is not lit. Press STOP to skip this nucleus.	504
6	The local display shows FPFLAP OPEN . Press PLAY to start the test. Press PLAY to confirm that the flap has opened. Press RECORD to indicate that the flap did not open. Press STOP to skip this nucleus.	522
7	The local display shows FPKEYBOARD . Press PLAY to start the test. Attention all keys have to be pressed to get a positive result! Press PLAY for more than one second to confirm that all the keys were pressed and shown on the local display. If not all the keys were pressed, a FAIL message will appear on the local display. Press RECORD for more than one second to indicate that not all keys were pressed and shown on the local display. Press STOP for more than one second to skip this nucleus.	505
8	The local display shows FPREMOTE CONTROL . Press PLAY to start the test. Press PLAY to confirm that a key on the remote control was pressed and shown on the local display. Only one key has to be pressed to get a successful result. Press RECORD to indicate that the key on the remote control was pressed but not shown on the local display. Press STOP to skip this nucleus.	506
9	The local display shows FPDIMMER . Press PLAY to start the test. Press PLAY to confirm that the text on the local display was dimmed. Press RECORD to indicate that the text on the local display was not dimmed. Press STOP to skip this nucleus.	518
10	The local display shows FPBEEPER . Press PLAY to start the test. Press PLAY to confirm that the beeper on the front panel sounded. Press RECORD to indicate that the beeper on the front panel did not sound. Press STOP to skip this nucleus.	514
11	The local display shows FPFLAP CLOSE . Press PLAY to start the test. Press STOP to skip this nucleus.	523
12	The local display shows ROUTE VIDEO . Press PLAY to start the test. Press STOP to skip this nucleus.	712
13	The local display shows ROUTE AUDIO . Press PLAY to start the test. Press STOP to skip this nucleus.	713
14	The local display shows COLOUR-BAR ON . Press PLAY to start the test. Press STOP to skip this nucleus.	120

STEP	DESCRIPTION	NUCLEUS
15	The local display shows PINK NOISE ON . Press PLAY to start the test. Press STOP to skip this nucleus.	115
16	The local display shows PINK NOISE OFF . Press PLAY to start the test. Press STOP to skip this nucleus.	116
17	The local display shows SINE ON . Press PLAY to start the test. Press STOP to stop the sine. Press STOP to skip this nucleus.	117
18	The local display shows COLOUR-BAR OFF . Press PLAY to start the test. Press STOP to skip this nucleus.	121
19	The local display shows BERESET . Press PLAY to start the test. Press STOP to skip this nucleus.	603
20	The local display shows BETRAY OPEN . Press PLAY to start the test. Press STOP to skip this nucleus.	616
21	The local display shows BETRAY CLOSE . Press PLAY to start the test. Press STOP to skip this nucleus.	615
22	The local display shows BEWRITE READ . Press PLAY to start the test. Press STOP to skip this nucleus.	617
23	The local display shows BETRAY OPEN . Press PLAY to start the test. Press STOP to skip this nucleus.	616
24	The local display shows BETRAY CLOSE . Press PLAY to start the test. Press STOP to skip this nucleus.	615
25	The local display shows READ ERRORLOG . Press PLAY to start the test. Press STOP to skip this nucleus. If the player test succeeded, the user/dealer script will start in an endless loop. If the player test failed, the local display will display FAIL and the error code	633

Remark

In case of failure, the display shows " FAIL XXXXXX ". The description of the shown error code can be retrieved in the survey of Nuclei Error Codes (paragraph 5.4). Once an error occurs, it is not possible to continue the player script. Unplug the set and restart the player script. By pressing the STOP key, it is possible to jump over the failure and to continue the player script.

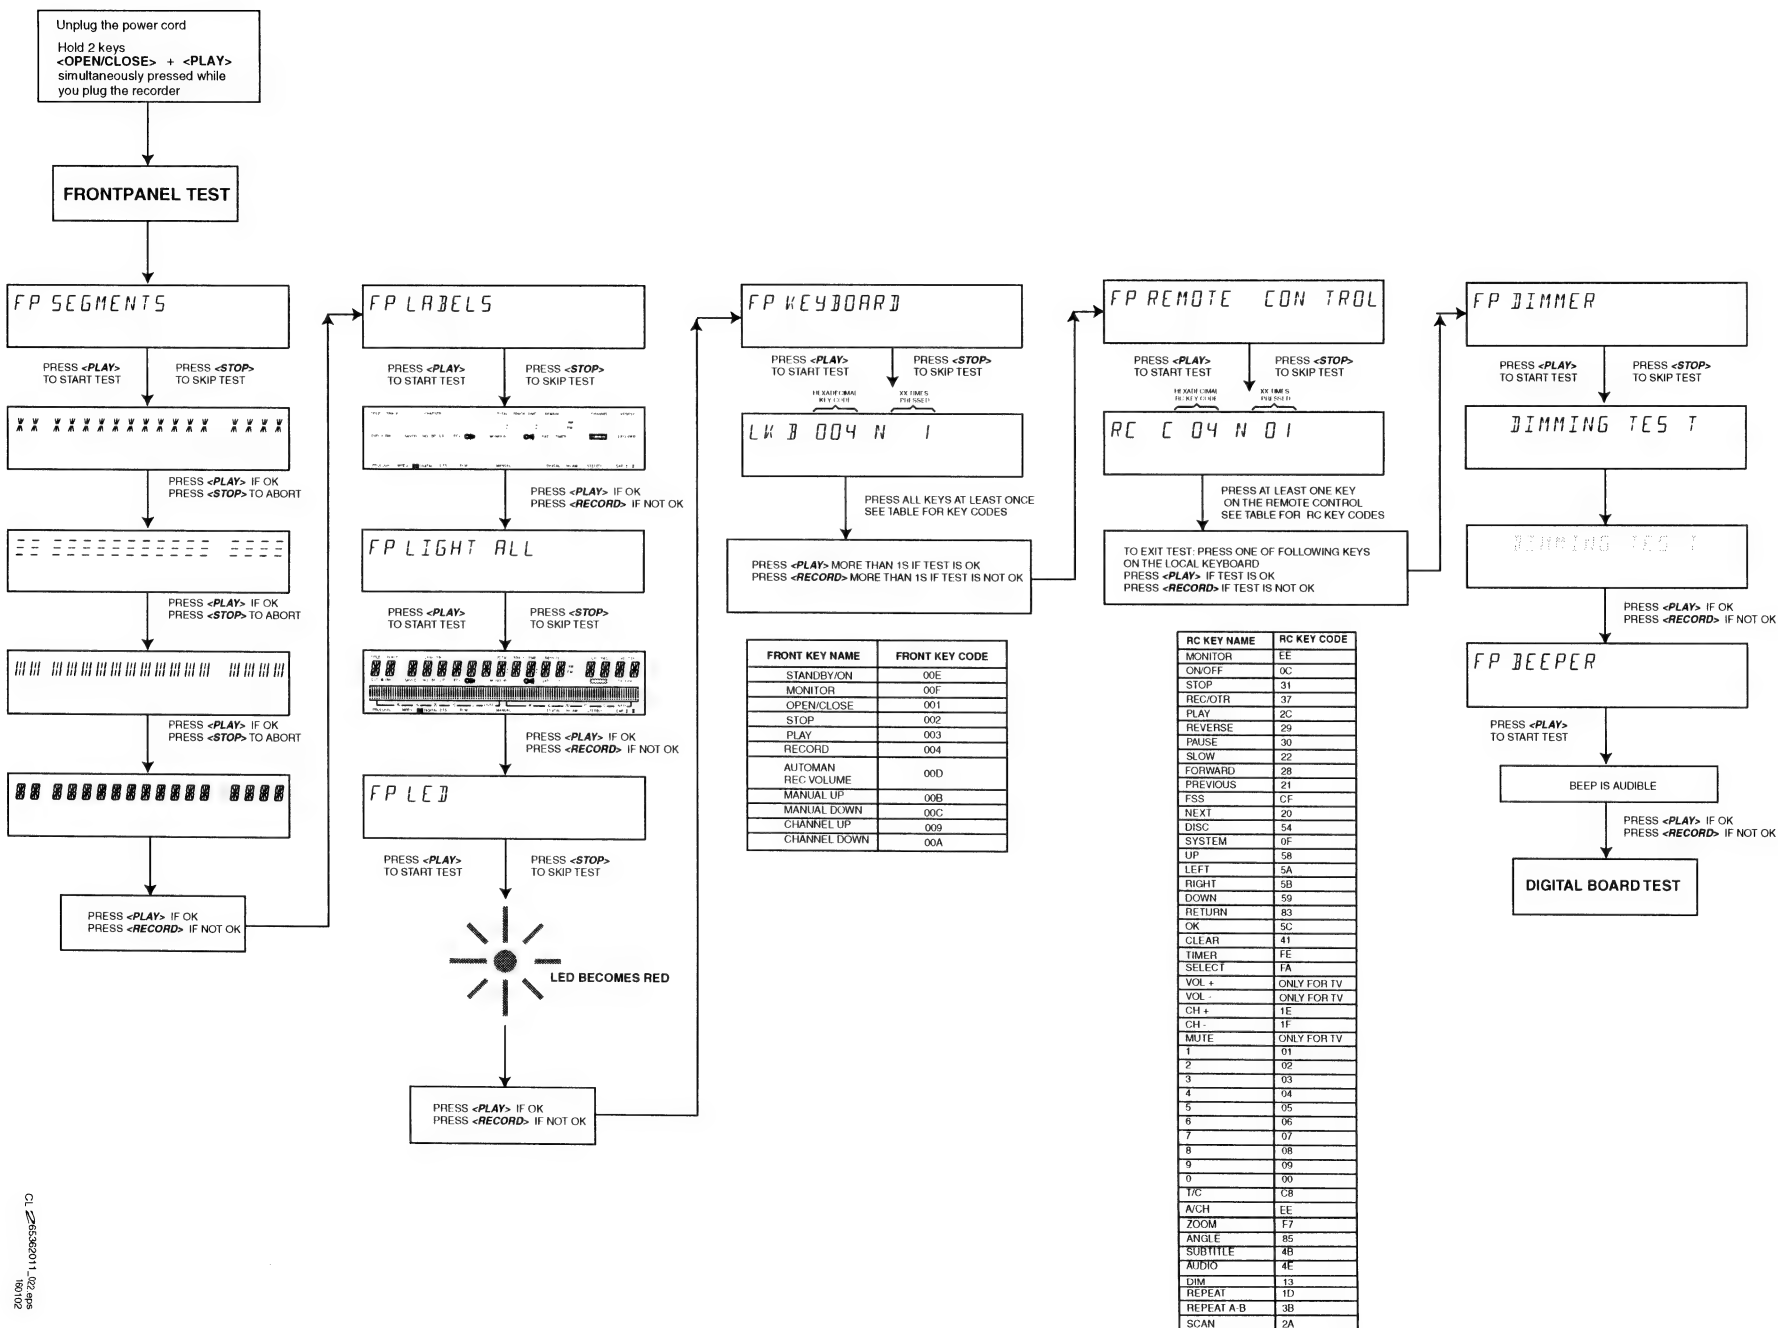

Figure 5-2

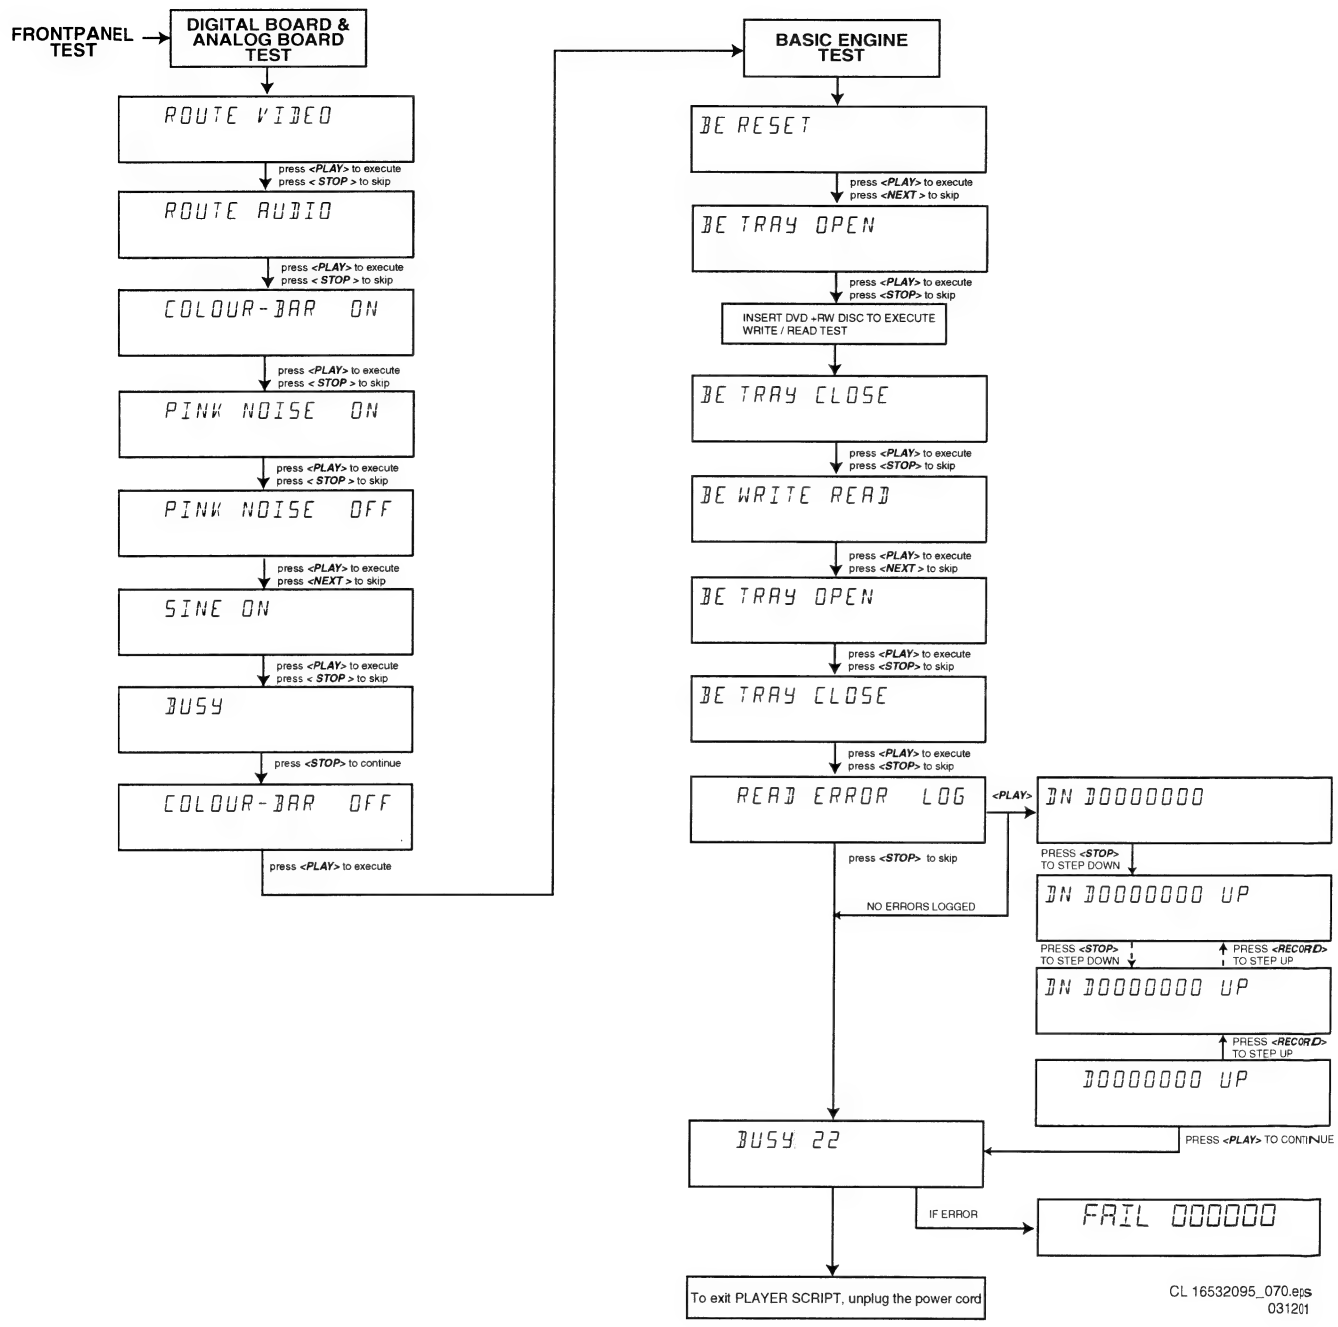

Figure 5-3

5.2.3 Error Log

Explanation:

The application errors will be logged in the NVRAM. The maximum number of error bytes that will be visible is 19. The last reported error is shown as DN D0000000, the oldest visible error as D0000000 UP and the errors in between as DN D0000000 UP. DN stands for DOWN, UP stands for UPWARDS. The shown D error codes are identical to the Nuclei Error Codes (paragraph 5.4).

5.2.4 Trade Mode

TRADE MODE

When the recorder is in Trade Mode, the recorder cannot be controlled by means of the front key buttons, but only by means of the remote control.

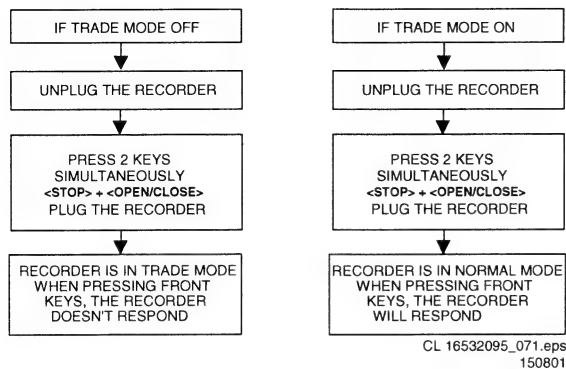

Figure 5-4

5.2.5 Virgin mode

If you want that the recorder starts up in Virgin mode, follow this procedure:

- Unplug the recorder
- plug the recorder again while you keep the STAND BY/ON key pressed
- the set starts up in Virgin mode.

5.3 Menu and Command Mode Interface

5.3.1 Nuclei Numeration

Each nucleus has a unique number of four digits. This number is the input of the command mode.

Figure 5-5

The following groups are defined:

Group number	Group name
0	Basic / Scripts
1	Host decoder (Sti5505 and memory)
2	Audio / video encoder (DVDR only)
3	VSM (DVDR only)
4	NVRAM
5	Front Panel
6	Basic Engine
7	Analogue board (DVDR only)
8	DVIO (DVDR only)
9	Loop nuclei (DVDR only)
10	Library sub nuclei (I2C nuclei)
11	User interface
12	Furore (SACD only)
13	DAC (SACD only)
14	Miscellaneous

5.3.2 Error Handling

Each nucleus returns an error code. This code contains six numerals, which means:

Figure 5-6

The nucleus group numbers and nucleus numbers are the same as above.

5.3.3 Command Mode Interface

Set-Up Physical Interface Components

Hardware required:

- Service PC
- one free COM port on the Service PC
- special cable to connect DVD recorder to Service PC

The service PC must have a terminal emulation program (e.g. OS2 WarpTerminal or Procomm) installed and must have a free COM port (e.g. COM1). Activate the terminal emulation program and check that the port settings for the free COM port are: 19200 bps, 8 data bits, no parity, 1 stop bit and no flow control. The free COM port must be connected via a special cable to the RS232 port of the DVD recorder. This special cable will also connect the test pin, which is available on the connector, to ground (i.e. activate test pin).

Code number of PC interface cable: 3122 785 90017

Activation

Plug the recorder to the mains and the following text will appear on the screen of the terminal (program):

Figure 5-7

The first line indicates that the Diagnostic software has been activated and contains the version number. The next lines are the successful result of the SDRAM interconnection test and the basic SDRAM test. The last line allows the user to choose between the three possible interface forms. If pressing C has made a choice for Command Interface, the prompt ("DD:>") will appear. The diagnostic software is now ready to receive commands. The commands that can be given are the numbers of the nuclei.

Command Overview

We provide an overview of the nuclei and their numbers. This overview is preliminary and subject to modifications.

Host Decoder [01]

[xx yy] Number	Nuclei
100	Checksum Flash
101	Flash Write Access 1
102	Flash Write Access 2
103	Flash Write Read
104	SdRam Write Read
105	SdRam Write Read Fast
106	Dram Write Read
107	Dram Write Read Fast
108	Hardware Version
109	Mute On
110	Mute Off
115	Pink Noise On
116	Pink Noise Off
117	Sine On
118	Sine Burst 1kHz
119	Sine Burst 12kHz
120	Colour-bar On
121	Colour-bar Off
122	NvramWrR
123	NvramI2c
130	Boot Version
131	Application Version
132	Diagnostics Version
133	Download Version
134	Write / read I2C message to / from digital board
135	Video Test Signal On
136	Video Test Signal Off
137	Macrovision Off

Audio Video Decoder [02]

[xx yy] Number	Nuclei
200	Video Encoder I2C
202	SAA7118 I2C
203	Audio Encoder SRAM Access
204	Audio Encoder Access
205	Audio Encoder SRAM Write Read
206	Audio Encoder Interrupts
207	Audio Encoder I2C
208	SAA7118 select input
209	Empress Version

VSM [03]

[xx yy] Number	Nuclei
300	Register Access
301	SDRAM Access
302	SDRAM Write Read
303	Interrupt lines
304	VSM Interconnection
305	UART

NVRAM [04]

[xx yy] Number	Nuclei
400	Reset
401	Read

[xx yy] Number	Nuclei
402	Modify
403	UniqueNr Read
404	Read Error Log
407	Reset Error Log
409	Line2 Region-Code Reset
410	UniqueNr Store

Front Panel [05]

[xx yy] Number	Nuclei
500	Echo
501	Version
502	Segment
503	Label
504	Led
505	Keyboard
506	Remote-Control
507	Segment Starburst
508	Segment Vertical
509	Segment Horizontal
514	Beeper
515	Discbar
516	Discbar Dots
517	Vu / Grid
518	Dimmer
519	Blinking
520	Light All Segments
522	Flap Open
523	Flap Close

Basic Engine [06]

[xx yy] Number	Nuclei
600	S2B Pass
601	S2B Echo
602	Version
603	Reset
604	Focus On
605	Focus Off
606	Disc Motor On
607	Disc Motor Off
608	Radial On
609	Radial Off

711	Nvram
712	Route Video
713	Route Audio
715	Set Slash Version
716	Application Version
717	Diagnostics Version
718	Download Version
720	Bargraph Level Adjustment
721	Clock correction
722	Clock reference
723	Re-virginise Recorder
724	Flash Checksum
725	Tuner frequency selection
727	Set virgin bit
728	Clear Virgin Bit
729	Write / read I2C message to / from analogue board
730	Store external presets
731	Get slash version
732	AFC Reference Voltage Tuner

DVIO [08]

[xx yy] Number	Nuclei
800	Check DVIO board presence
801	Reset DVIO
802	DVIO Access
803	Get DVIO error codes
804	Get DVIO module Ids
805	Execute DVIO module SelfTest
806	Set DVIO led on.
807	Set DVIO led off.

Loop Nuclei [09]

[xx yy] Number	Nuclei
900	Digital Audio Loop
901	User / Dealer Audio Loop
902	Digital Video Loop
903	Digital Video VBI Loop
904	System Video Loop
905	System Video VBI Loop

[xx yy] Number	Nuclei
906	User / Dealer Video Loop
907	User / Dealer Video VBI Loop
908	System Audio Loop SCART
909	System Audio Loop CINCH
910	Digital DVIO Video Loop
911	System Video Vip

Miscellaneous [14]

[xx yy] Number	Nuclei
1400	Clock 11.289 MHz
1401	Clock 12.288 MHz
1412	Progressive Scan I2C
1413	Progressive Scan test image on
1414	Progressive Scan test image off
1415	Progressive Scan Route Enable
1416	Progressive Scan Route Disable

Scripts [00]

[xx yy] Number	Nuclei
1	UserDealer Script
2	Player Script

5.3.4 Menu Mode Interace

Activation

Plug the recorder to the mains and the following text will appear on the screen of the terminal (program):

DVD Video Recorder Diagnostic Software version 48	
Basic SDRAM Data bus test passed	
Basic SDRAM Address bus test passed	
Basic SDRAM Device test passed	
(M) enu, (C) ommand or (S) 2B-interface? [M] : @ M ↵	
Main Menu	
1. Digital Board	->
2. Analogue Board	->
3. Front Panel	->
4. Basic Engine	->
5. DVIO	->
6. Progressive Scan Board	->
7. Loop tests	->
8. Log	->
9. Scripts	->
Select>	

Figure 5-8

The first line indicates that the Diagnostic software has been activated and contains the version number. The next lines are the successful result of the SDRAM interconnection test and the basic SDRAM test. The last line allows the user to choose between the three possible interface forms. If pressing M has made a choice for Menu Interface, the Main Menu will appear.

Menu Structure

The following menu structure is given after starting up the DVD recorder in menu mode. The symbol -> indicates that the current menu choice will invoke the display of a submenu.

Main Menu

- 1.Digital Board ->
- 2.Analogue Board ->
- 3.Front Panel ->
- 4.Basic Engine ->
- 5.DVIO ->
- 6.Progressive Scan Board ->
- 7.Loop Tests ->
- 8.Log ->

5.5 Loop tests

The following loops can be distinguished:

- Loops performed on the digital board only
- User Dealer loops performed on the digital and analogue board
- System loops performed via an external connection: outputs are looped back to the inputs.

5.5.1 Nucleus 900: Digital Audio Loop

This nucleus tests the audio path through the digital board

NUCLEUS 900: AUDIO LOOP DIGITAL

Figure 5-9

5.5.2 Nucleus 901: Audio User Dealer Loop

A PCM audio sine of 12kHz is generated in the Host Decoder for a while and sent to the analogue board. The signal coming from the analogue board is encoded again and sent to the memory of the host decoder for comparison. This nucleus tests the components on the audio signal path:

- Host decoder
- Flex connection between connector 1602 (digital board) and connector 1900 (analogue board)
- DAC
- Op-amp
- Scart switch IC
- ADC
- Audio Encoder
- VIP
- VSM

Figure 5-10

5.5.3 Nucleus 902: Digital Video Loop

A colourbar generated in the host decoder is looped through the VIP, Empire, and VSM and checked again in the host decoder. The following components are tested on the video signal path:

- VIP
- Empire
- VSM
- Host decoder

Figure 5-11

5.5.4 Nucleus 903: Digital Video VBI Loop

Nucleus for testing the components on the video VBI signal path:

- The VIP
- The VSM
- The Host Decoder

This is done by using the internal test signal source (digital board only)

Remark: this test is only successful if nucleus 121 is carried out first.

NUCLEUS 903: DIGITAL VIDEO VBI LOOP

Figure 5-12

5.5.5 Nucleus 904: System Video Loop

Nucleus for testing the components on the video signal system path:

- The VIP
- The video encoder
- The VSM
- The host decoder
- The analogue board

On the analogue board the video signal will be routed to the SCART (EUROPE) or CINCH (NAFTA). There it will be looped back externally by means of the proper cable

NUCLEUS 904: SYSTEM VIDEO LOOP

Figure 5-13

5.5.6 Nucleus 905: System Video VBI Loop

This nucleus tests the components on the video signal path:

- The VIP
- The VSM
- The Host Decoder

The video CVBS signal is routed to the output of the analogue board where it will be looped back by means of an external cable

Remark: this test is only successful if nucleus 121 is carried out first.

Figure 5-14

5.5.7 Nucleus 906: Video User Dealer Loop

Nucleus for testing the components on the video signal system path:

- The VIP
- The video encoder
- The VSM
- The host decoder
- The analogue board

On the analogue board, the video signal is internally routed back to the digital board.

Figure 5-15

5.5.8 Nucleus 907: Video VBI User Dealer Loop

This nucleus tests the components on the video VBI signal path:

- The VIP
- The VSM
- The Host Decoder

The signal is routed back internally on the analogue board

Remark: this test is only successful if nucleus 121 is carried out first.

Figure 5-16

5.5.9 Nucleus 908: System Audio Loop Scart (Europe)

Nucleus for testing the components on the audio signal path:

- The hostdecoder
- The analogue board
- The audio encoder
- The VSM

On the analogue board, audio is passed to the SCART connector, where a SCART cable needs to be used to loop back the audio signal to the digital board

Figure 5-17

5.5.10 Nucleus 909: System Audio Loop CINCH (Nafta)

Nucleus for testing the components on the audio signal path:

- The hostdecoder
- The analogue board
- The audio encoder
- The VSM

On the analogue board the audio is passed to the CINCH connector, where a CINCH cable needs to be used to loop back the audio signal to the digital board

Routing Audio and Video**Route Video**

Nucleus Number: 712

Description

This nucleus routes the video signals on the analogue board to the destination determined by the input parameters

The paths that are available for video routing and their description(Europe version)

PATH ID	DESCRIPTION
00	Input signal is VIDEO(CVBS) from digital board and will be re-routed back to the digital board.
01	Input signal is from FRONT VIDEO(CVBS) IN and will be routed to the digital board.
02	Input signal is from REAR VIDEO(CVBS) IN and will be routed to the digital board.
03	Input signal is from FRONT S-VIDEO(Y/C) and will be routed to the digital board.
04	Input signal is from REAR S-VIDEO(Y/C) and will be routed to the digital board.
05	Input signal is CVBS from SCART1 and will be routed to the digital board.
06	Input signal is CVBS from SCART2 and will be routed to the digital board.
07	No routing.
08	Input signal is VIDEO(CVBS) from ANTENNA IN and will be routed to SCART1.
09	Input signal is VIDEO(CVBS) from SCART1 and will be routed to SCART2.
10	Input signal is VIDEO(CVBS) from SCART2 and will be routed to SCART1.
11	No routing.
12	Input signal is from REAR VIDEO(CVBS) IN and will be routed to SCART1 and SCART2.
13	Input signal is from FRONT VIDEO(CVBS) IN and will be routed to SCART1.
14	Input signals VIDEO(CVBS and Y/C) from SCART 1 will be routed to SCART2.
15	Input signal is from REAR S-VIDEO(Y/C) IN and will be routed to SCART2.
16	Input signal is from FRONT S-VIDEO(Y/C) IN and will be routed to SCART2.
17	No routing
18	No routing
19	Input signals VIDEO(RED and FAST BLANKING) from SCART2 will be routed to the corresponding pins of SCART1.
20	Signal path is routed from digital board RGB to RGB SCART1 and from RGB SCART2 to digital board YUV and from digital board CVBS to digital board CVBS.
21	Signal path is routed from digital board YC to REAR S-VIDEO(YC) OUT and from REAR S-VIDEO(YC) IN to digital board YC.

The paths that are available for video routing and their description (Nafta region)

PATH ID	DESCRIPTION
00	Input signal is VIDEO(CVBS) from digital board and will be re-routed back to the digital board.
01	Input signal is from FRONT VIDEO(CVBS) IN and will be routed to the digital board.
02	Input signal is from REAR VIDEO(CVBS) IN and will be routed to the digital board.
03	Input signal is from FRONT S-VIDEO(Y/C) IN and the signal received will be routed to the digital board.

PATH ID	DESCRIPTION
04	Input signal is from REAR S-VIDEO(Y/C) IN and will be routed to the digital board.
05	Input signal is from YUV IN and will be routed to the digital board.
06	No routing.
07	No routing.
08	Input signal is VIDEO(CVBS) from ANTENNA IN and will be routed to VIDEO(CVBS) OUT and .
09	Input signal is from YUV IN and will be routed to YUV OUT.
10	No routing.
11	No routing.
12	Input signal is from REAR VIDEO(CVBS) IN and will be routed to REAR VIDEO(CVBS) OUT.
13	Input signal is from FRONT VIDEO(CVBS) IN and will be routed to REAR VIDEO(CVBS) OUT.
14	Input signal is from REAR S-VIDEO(Y/C) IN and will be routed to REAR S-VIDEO(Y/C) OUT.
15	Input signal is from FRONT S-VIDEO(Y/C) IN and will be routed to REAR S-VIDEO(Y/C) OUT.
16	No routing.
17	Signal path is routed from digital board RGB to REAR VIDEO(YUV) OUT and from REAR VIDEO(YUV) IN to digital board YUV and from digital board CVBS to digital board CVBS.
18	Signal path is routed from digital board CVBS to REAR VIDEO(CVBS) OUT and from REAR VIDEO(CVBS) IN to digital board CVBS.
19	Signal path is routed from digital board YC to REAR S-VIDEO(YC) OUT and from REAR S-VIDEO(YC) IN to digital board YC.

Example

DD:> 712 01

71200: Video routing on the Analogue Board OK.

Test OK @

Route Audio

Nucleus Number: 713

Description

This nucleus routes the audio on the analogue board to the destination determined by the input parameters

The paths that are available for audio routing and their description (Europe version)

PATH ID	DESCRIPTION
00	Input signal is VIDEO(CVBS) from digital board and will be re-routed back to the digital board.
01	Input signal is from FRONT AUDIO IN and will be routed to the digital board.
02	Input signal is from REAR AUDIO IN and will be routed to the digital board.
03	Input signal is AUDIO from SCART1 and will be routed to the digital board.
04	Input signal is AUDIO from SCART2 and will be routed to the digital board.
05	No routing.
06	No routing.
07	No routing.
08	Input signal is VIDEO(CVBS) and AUDIO from ANTENNA IN and will be routed to SCART1.
09	Input signal is VIDEO(CVBS) and AUDIO from SCART1 and will be routed to SCART2.
10	Input signal is VIDEO(CVBS) and AUDIO from SCART2 and will be routed to SCART1.
11	Input signal is AUDIO from dvio board and will be routed to SCART1.

PATH ID	DESCRIPTION
12	No routing.
13	No routing.
14	No routing.
15	No routing.
16	No routing.
17	Input signal is from REAR AUDIO IN and will be routed to SCART1.
18	Input signal is from FRONT AUDIO IN and will be routed to SCART1.

The paths that are available for audio routing and their description (Nafta region)

PATH ID	DESCRIPTION
00	Input signal is VIDEO(CVBS) from digital board and will be re-routed back to the digital board.
01	Input signal is from FRONT AUDIO IN and will be routed to the digital board.
02	Input signal is from REAR AUDIO IN 2 and will be routed to the digital board.
03	Input signal is from FRONT AUDIO IN and will be routed to the digital board.
04	No routing.
05	No routing.
06	No routing.
07	No routing.
08	Input signal is VIDEO(CVBS) and AUDIO from ANTENNA IN and will be routed to VIDEO(CVBS) OUT and REAR CINCH OUT 2.
09	No routing.
10	Input signal is from REAR AUDIO CINCH IN 2 and will be routed to REAR AUDIO CINCH OUT 2.
11	Input signal is from FRONT AUDIO CINCH IN and will be routed to REAR AUDIO CINCH OUT 2.
12	No routing.
13	No routing.
14	No routing.
15	No routing.
16	Input signal is AUDIO from dvio board and will be routed to AUDIO CINCH OUT 2.
17	No routing.
18	No routing.
19	No routing.
20	Input signal is from digital board and will be routed to the REAR AUDIO OUT 1 and input signal is from REAR AUDIO IN 2 and will be routed to the digital board.
21	Input signal is from digital board and will be routed to the REAR AUDIO OUT 1 and input signal is from REAR AUDIO IN 1 and will be routed to the digital board.
22	Input signal is from digital board and will be routed to the REAR AUDIO OUT 2 and input signal is from REAR AUDIO IN 1 and will be routed to the digital board.

EXAMPLE

DD:> 713 00

71300: Audio routing on the Analogue Board OK.

Test OK @

5

This image shows a single sheet of white paper with horizontal ruling lines. The lines are evenly spaced and run across the width of the page. There is no text or other markings on the paper.

[illegible]

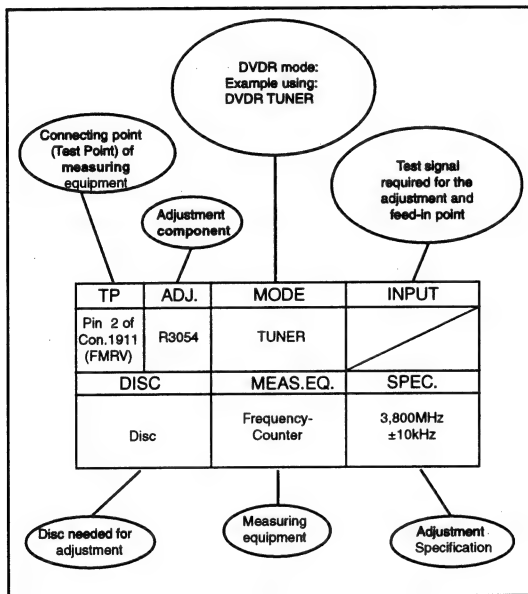

8. Alignments

8.1 Alignment Instructions Analogue Board

Test equipment:

1. Dual-trace oscilloscope
Voltage range : 0.001 ~ 50 V/div
Frequency : DC ~ 50 MHz
Probe : 10:1, 1:1
2. DVM (Digital voltmeter)
3. Frequency counter
4. Sinus generator
Sinus : 0 ~ 50 MHz
5. Test pattern generator

How to read the adjustment procedures:

Front End (FV)

Service tasks after replacement of IC 7703, coil L5702 and L5703:

1 AFC Adjustment:

Purpose: Correct adjustment of demodulator AFC - circuit

Symptom, if incorrectly set:

Bad or disturbed TV channel reception.

PAL - AFC adjustment [5703]:

TP	ADJ.	MODE	INPUT
IC 7703 Pin 17 (I976)	L5703	TUNER	38,9MHz 500mV _{pp} at Tuner 1705, Pin 11 (F700, IF-out)
DISC		MEAS.EQ.	SPEC.
		DC Voltmeter Frequ. Generator	2,5V ±0,1V

Storage in NVRAM via command mode interface of DSW:

After adjustment, the AFC reference value has to be stored in the NVRAM. This reference value is 256 * measured voltage/Ucc. Ucc is 5.0V.

Store the reference value via command 732, followed by the ref. value.

Example: DD:> 732 128

2 HF - AGC adjustment [3707]:

Service tasks after replacement of IC 7703:

Purpose: Set amplifier control.

Symptom, if incorrectly set:

Picture jitter if input level is too low and picture distortion if input level is too high.

TP	ADJ.	MODE	INPUT
Tuner 1705 Pin 11 (F700, IF-out)	R3707	Set tuned to channel 25 503.25 MHz	5mV(74dBμV) on aerial input PAL white picture, audio IF on, no modulation
DISC		MEAS.EQ.	SPEC.
		Oscilloscope Video Pattern Generator	500mV _{pp} +/-0.5dB (use a 10:1 probe)

3 Attenuating the 40.4 MHz [5702]: (SECAM only)

Service tasks after replacement of coil 5702:

Purpose: To attenuate the band I carrier rests.

Symptom, if incorrectly set:

Bad picture quality when the filter attenuates the picture carrier (38.9MHz).

TP	ADJ.	MODE	INPUT
OFW 1700 Pin 1 (F704)	L5702	TUNER	40.4 MHz, 200mV _{me} at Tuner 1705, Pin 11 (F700, IF-out)
DISC		MEAS.EQ.	SPEC.
		Oscilloscope, Sinus Generator, Counter	adjust minimum amplitude

If the adjustment is correct the signal at pin 1 of OFW [1700] must be smaller than the input signal amplitude by at least 6 dB.

Figure 8-1

8.2 Reprogramming Procedure of NVM on the Analogue PCB

The NVM, item 7815, on the Analogue board contains the following factory settings:

1. Bargraph 0dB correction factor
2. Clock correction factor
3. AFC reference value
4. Slash version

The settings 1,2 and 3 are stored in the NVM during the production of the analogue board.

The slash version is stored at the end of the production line of the set.

In case of failure, the NVM must be replaced by an empty device. By way of commands via the Diagnostic Software or via ComPair, the factory settings must be restored in the NVM.

8.2.1 Bargraph 0dB Alignment

For an exact functionality of the bar graph in the display, a correction factor for the left and the right channel is stored in the NVM.

Procedure:

- put the set in DSW command mode
- route Audio path from Audio front connectors to digital with the following command: DD:> 713 01
- apply a sine wave of 1kHz, 1.65 Vrms (0dB) to the front connectors, audio left and right
- store 0dB bar graph level with command 720:
DD:>720

8.2.2 Clock Correction Adjustment

To guarantee an exact function of the real time clock, an adjustment of the clock frequency is possible. The adjustment value is stored in the NVM.

Procedure:

- connect a pull up resistor of 10k between pin 7 and 8 of the clock IC PCF8593T, item 7811, on the analogue PCB
- put the set in service command mode
- execute command 722 to initiate that a 1Hz signal is available on pin 7 of the clock IC
DD:>722
- measure the frequency of the Clock Crystal with an accuracy of ± 1 us. Normally the measured frequency must be between 999902 us and 1000097 us. If the frequency is outside this range, the clock IC must be replaced.
- Execute command 721 with the measured frequency as an input parameter
example:
DD:>721 1000023

8.2.3 AFC Reference Voltage Tuner

This function stores the reference voltage for the tuner in the NVM. Before this value can be stored, the AFC adjustment, described in the adjustment instructions of the analogue board, must be carried out.

Procedure:

- Adjust AFC circuit
- Calculate the reference value
- Execute command 732 and use the calculated reference value as parameter
example:
DD:>732 128

8.2.4 Slash Version

The slash version is stored with command 715 followed by the slash version as parameter.

The slash versions used in DVDR990 are the following:

- DVDR990/001: 7
- DVDR990/021: 7
- DVDR990/051: 4

Example:

DD:>715 7

Reset of Slash Version

Use command 729 to reset the analogue board to the default setting.

Procedure:

- Put the set in DSW command mode
- Execute command 729 with the following parameters:
DD:> 729 w 0xA0 3 0x07 0xD0 0x00
- Leave the DSW command mode and start up the set in application mode No background is visible on the TV screen. The analogue board is ready to accept the appropriate slash version.

8.3 Rework Procedure IEEE Unique Number

8.3.1 Scope:

The procedure describes how to upgrade sets with a unique number after repair. This unique number is stored in the NVRAM (item 7201) of the digital board at the end of the production line.

This procedure is only valid or necessary when:

- The digital board is replaced
- NVRAM on the digital board is replaced
- NVRAM is cleared

In all other cases the repaired set retains its unique number.

The procedure defines several means to re-assure the unique number depending on the possibilities of repair or the state the faulty set is in.

8.3.2 Handling:

State of Original (Defective) Board:

1. The digital board starts up in Diagnostics Mode: follow procedure A to retrieve the valid unique number
2. The digital board does NOT start up in Diagnostics Mode: follow procedure B.

8.3.3 Procedure A

1. Connect defective digital board to PC via serial cable (3122 785 90017)
2. start up hyper terminal or any other serial terminal via the correct settings (DSW command mode interface)
3. read out existing unique number via nucleus 403
example:
DD:> 403
40300: DV Unique ID = 00D7A1FC6C
Test OK @
4. note read out
5. program new digital board via nucleus 410
example: DD:> 410 00D7A1FC6C
41000:
Test OK @

The set has now the original unique number

8.3.4 Procedure B

1. Note the serial number of the set example:
AH050136130156

- AH = production centre Hasselt. According to UAW-500: A=1 and H=8
 - 05 = change code (this is not used for this calculation)
 - 01 = YEAR
 - 36 = Production WEEK
 - 130156 = Lot and SERIAL number
2. Calculate the unique number: this number always exists out of 10 hexadecimal numbers.
 3. First 5 numbers: First we calculate a decimal number according to the formula below: $35828 \cdot \text{YEAR} + 676 \cdot \text{WEEK} + 26 \cdot A + H + 8788$ The figures are fixed, YEAR + WEEK + factory code (A + H) are variable
Example: $35828 \cdot 01 + 676 \cdot 36 + 26 \cdot 1 + 8 + 8788 = 68986$ (decimal) Then we translate the decimal number to a hexadecimal number.
example: 68986 (decimal) = 10D7A (hex)
 4. Last 5 numbers: The last 5 numbers exist out of the Lot and SERIAL number. We have to translate the decimal number to the next 5 hexadecimal numbers:
Example: 130156 (decimal) = 1FC6C (hex)
 5. Program new digital board via nucleus 410 Therefore we use the 10 hexadecimal numbers we calculated above:
example:
DD:> 410 10D7A1FC6C
41000:
Test OK @

The set has now its original unique number

8.4 Adjustment DVIO 1.8 PCB

1. Disconnect DVD+RW set from the mains.
2. Plug DVIO1.8 board via edge-connector onto Digital Board (DVIO board is vertically oriented, so that both sides of the PCB are accessible for measurements).
3. Connect DVD+RW set to the mains.
4. Turn DVD+RW set on and select any video input source except the DV input.
5. Check the signal at test point F611 with an oscilloscope. The signal should be 5V digital with 50% duty-cycle.
6. Measure the frequency of the signal at test point F610 and adjust the potentiometer 3605 to get a frequency of 12.288MHz ± 50 kHz (after removing the screwdriver from the potentiometer).
 - 6a. In case the frequency can not be increased sufficiently, replace capacitor 2618 by NP0-type capacitor with 18pF. Adjust afterwards again the frequency with the potentiometer.
 - 6b. In case the frequency can not be decreased sufficiently, add (3pF-10pF) trim-capacitor in parallel to capacitor 2618 or replace capacitor 2618 by NP0-type capacitor with 27pF. Adjust afterwards again the frequency with the potentiometer (and/or trim-capacitor).
7. Switch DVD+RW set to Stand-by mode.
8. Disconnect the DVD+RW set from the mains.
9. Plug DVIO1.8 board directly (without edge connector) onto Digital Board.
10. Connect DVD+RW set to the mains.
11. Connect a DV-source that transmits DV-video data with audio to the DVD+RW set.
12. Turn DVD+RW set on, select DV input, and switch DVD+RW set appropriately to output the decoded signal. Audio should be output without distortion.

9. Circuit-, IC Descriptions and List of Abbreviations

9.1 Multi-Mode SOPS 50PS203

9.1.1 Why Multi-Mode SOPS?

Using ordinary SOPS results in a decrease of the efficiency at low output loads due to the increase of the switching frequency. The Multi-Mode SOPS will reduce the switching frequency at low loads but still preserves valley switching.

9.1.2 Block Diagram

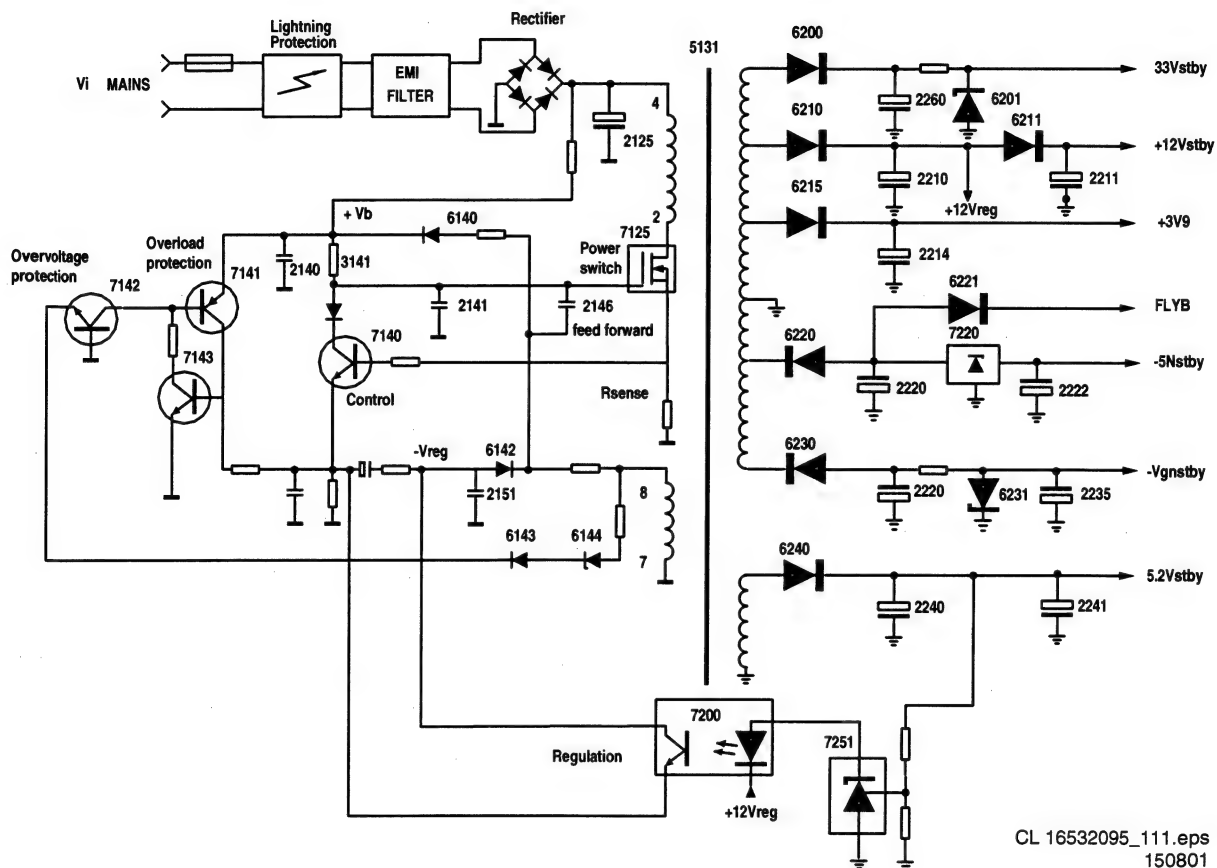

Figure 9-1

9.1.3 Circuit Description

Input Circuit

The input circuit consists of a lightning protection circuit and an EMI filter.

The lightning protection comprises R3120, sparkgaps 1124 and 1125. D6128, 6129, C2127 and R3129 are optional. L5110, L5115, C2120 and L5120 form the EMI filter. It prevents inflow of noises into the mains.

Primary Rectifier/smoothing Circuit

The AC input is rectified by diodes 6151, 6152, 6153, 6154 and smoothed into C2125. The voltage over C2125 is approximately 300V. It can vary from 200V to 390V.

Start Circuit

This circuit is formed by R3125, 3126, R3141, C2140 and R3132.

When the power plug is connected to the mains voltage, the MOSFET 7125 will start conducting as soon as the gate

voltage reaches a threshold value. A current starts to flow in primary winding 2-4. The MOSFET will be fed forward via winding 7-8, R3150 and C2146.

+Vb Supply and Negative Regulation Voltage

The positive part of the voltage over winding 7-8 will be rectified via R3150, D6140 and charged via R3140 into C2140. The voltage over C2140 has a value of +30 till +40V. This value depends on the value of the mains voltage V_i and the load. The negative part of the voltage over winding 7-8 will be rectified via R3150, D6142 and charged into C2151. The voltage over C2151 has a value of -15V and is used as regulation voltage.

Control Circuit

The control circuit exists of T7140, D6141, C2144 and 2145, C2147, R3147 and 3148.

This circuit is fed by supply voltage +Vb via R3141. This circuit controls the conduction time and the switching frequency of the power switch circuit. It switches off the MOSFET as soon as the voltage over Rsense reaches a certain value. This value

CL 16532095_111.eps
150801

depends on the error voltage at the emitter of T7140, which can be positive or negative (+/- 0,66V). The voltage fed back by the regulation circuit defines this error voltage.

Power Switch Circuit

This circuit comprises MOSFET 7125, Rsense formed by R3133, 3134, 3135, 3136 and 3137, R3131, R3132, D6146. Diodes 6130, 6131 and 6132 protect the control circuit in case of failure of the MOSFET.

Regulation Circuit

The regulation circuit comprises opto-coupler 7200, which isolates the base voltage of transistor 7140 at the primary side from a reference component 7251 at the secondary side. The TL431(7251) can be represented by two components:

- a very stable and accurate reference diode
- a high gain amplifier

Figure 9-2

TL431 will conduct from cathode to anode when the reference is higher than the internal reference voltage of about 2.5V. If the reference voltage is lower, the cathode current is almost zero. The cathode current flows through the LED of the opto-coupler. The collector current of the opto-coupler will adjust the feedback level of the error voltage at the emitter of T7140.

Overload Protection Circuit

This circuit consists of R3145, C2143, a thyristor circuit formed by T7141 and T7143, R3143 and R3142. When the output is shortened, the thyristor circuit will start to conduct and switch off the supply voltage over C2140. This results in a switching off of the drain current of the MOSFET 7125 and the output will be disabled. The start circuit will try to start up the power supply again. If the circuit is still shortened, the complete start and stop sequence will repeat. The power supply comes in a hiccup mode (is ticking).

Overvoltage Protection Circuit

This circuit consists of R3149, D6144, 6143, R3144, C2142 and T7142.

When the regulation circuit is interrupted due to an error in the control loop, the regulated output voltage will increase (overvoltage). This overvoltage is sensed on the primary winding 7-8.

When an overvoltage is detected, the circuit will start up the thyristor circuit T7141-7143. The power supply will come in a hiccup mode as long as the error in the control loop is present.

Secondary Rectifier/Smoothing Circuit

There are 6 rectifier/smoothing circuits on the secondary side. Each voltage depends on the number of windings of the transformer.

From these circuits a lot of voltages are derived and fed to 3 connectors. The following voltages are present at the output: Connector 209

Functional use: to Digital board + Dvio board

1. +3V3(for dig pcb + DVio)
2. +3V3(for dig pcb + DVio)
3. +3V3(for dig pcb + DVio)

4. +3V3(for dig pcb + DVio)
5. GND(for dig pcb + DVio)
6. +12V(for dig pcb + DVio)
7. GND(for dig pcb + DVio)
8. GND(for dig pcb + DVio)
9. +5V(for dig pcb + DVio)
10. STBY control(for dig pcb + DVio)
11. GND(for dig pcb + DVio)
12. -5V(for dig pcb + DVio)

The +12V is switched off by the STBY_ctrl signal.

When the +12V is switched off, also the +3V3, +5V and -5V are switched off. All these voltages are low drop regulated.

Connector 0205

Functional use: to analogue board + display board + flap motor 'STBY' indicates that the voltage will not be switched off in the standby situation.

1. +12VSTBY(= +12V Standby; for display heating, 8Vstby)
2. +5VSTBY(= +5V Standby; general use)
3. -5NSTBY(= -5V Standby; neg. voltage for drivers)
4. VGNSTBY(= -32V Standby; for display grids)
5. +33STBY(= +33V Standby; for tuner)
6. FLYB(flyback pulse for power fail + measurement)
7. GNDA(Ground for the analogue board)

Connector 0207

Functional use: to engine

1. +3V3(for engine servo board)
2. +5V(for engine servo board)
3. GND(for engine servo board)
4. +4V6E(for engine analog part)
5. GND(for engine servo board)
6. -5V(for engine servo board)
7. GND(for engine motor currents)
8. +12V(for engine motor currents)

9.2 Display Board

9.2.1 Operation Unit DC (DC Part)

The core element of the operation unit DC is the microcontroller TMP88CU77ZF [7156]. The TMP88CU77ZF is an 8 bit microcontroller fitted with 96kB ROM and 3kB RAM and is responsible for following functions:

- Integrated VFD driver
- Timer
- Evaluation of the keyboard matrix
- Decoding the remote control commands from the infra-red receiver pos. 6170
- Activation of the display
- Motor driver

The system clock is generated with the 12MHz quartz (Pos. 1153).

9.2.2 Evaluation of the Keyboard Matrix

There are 15 different keys on the display board. A resistor network is used to generate a specific direct voltage value, depending on the key pressed, via the resistors 3145, 3171, 3183 and 3194 on the analog/digital (A/D) pots (7156 Pin 17, 18, 19, 20). Pressing keys simultaneously may lead to undesired functions!

9.2.3 IR Receiver and Signal Evaluation

The IR receiver [7140] contains a selectively controlled amplifier as well as a photo-diode. The photo-diode changes the received transmission (approx. 940nm) in electrical pulses, which are then amplified and demodulated. On the output of the IR receiver [7140], a pulse sequence with TTL-level, which corresponds to the envelope curve of the received IR remote control command, can be measured. This pulse sequence is input into the controller for further signal evaluation via input IRR [7156, pin 2].

9.2.4 Bi-Color LED (Standby and ON)

The STBY-LED is a red/green bi-color-LED and is controlled via the STBYLED-signal of the P (7156 Pin 10) in the following way:

Colour of STBY LED	Status of the Set
red	STBY
green	ON

9.3 Analogue Board Europe

9.3.1 Microprocessor TMP93C071F

The microcontroller „AIO“ TMP93C071F is a 16bit microcontroller with internal ROM and 8kB RAM. It includes the following functions:

- A/D converters
- composite sync input
- I²C bus interface

Following connection to the mains, a positive pulse on the reset input on the P is generated by the reset-IC TL7705 (Pos.7900). The system clock is generated with the 20MHz quartz (Pos. 1994).

9.3.2 Bus Systems

The communication between the P and the other functional groups is via the I²C-bus (SDA, SCL). The clock rate is approx. 95kHz.

Functional groups on the I²C bus:

- E²PROM ST24E16 (Pos. 7815)
- Tuner (Pos. 1705)
- Matrix-switch STV6410 (Pos. 7507)
- Audio IC / MSP (Pos. 7600)
- Display board (Pos. 1987)
- VPS-IC (Pos. 7990).

9.3.3 E²PROM

The E²PROM ST24E16 (Pos. 7815) is an electric erasable and programmable, non-volatile memory. The E²PROM stores data specific to the device, such as the AFC-reference value, clock-correction-factor, etc. The data is accessed by the P via the I²C-bus.

9.3.4 VPS, PDC, Teletext (Europe Only)

The STV5348 (Pos. 7990) is a VPS, PDC, and Teletext Decoder with an external 13,875Mhz quartz.

The following data formats are identified:

- VPS (Timer data and station name)
- PDC Format 2 (Timer data and station name)
- PDC Format 1 (station name and time)
- TXT header line (time for „time download“)

9.3.5 FOME

The FOME-circuit compares the video signal coming from the tuner and the one coming from the Scart-plug 1. If the video-signals are identical the output of the FOME-circuit is low.

9.3.6 Fan Control

The fan control circuit is necessary to control the speed of the cabinet fan (Pos. 1984) according to the requirements in temperature and noise. The temperature is measured via an NTC on the display board (Pos. 3145). When the temperature is lower than 25°C the fan-voltage is approx. 5V and will reach approx. 10V at a temperature of 40°C. It is also possible to

switch off the fan via the control line ION_FAN. The circuit generates also two control-signals: TEMP goes to the P and BE_FAN is the control-line for the basic engine fan.

9.3.7 Power Supply

The 5SW and 8SW supply are switched off in case of standby from the P via the ISTBY-line. This is possible for power-save. The ISTBY-line must be low in case of STBY. There is also a „power fail“ circuit on the PS-schematic which is necessary to mute AUDIO when IPFAIL is low.

9.3.8 Front End (TU, AP Part)

The Front End Comprises the Following Parts:

- Tuner [1705]
- IF amplifier & video demodulator IC TDA 9818 [7703]
- Sound processor MSP3415G [7600]

IF Selection

The IF frequency of the video carrier is 38.9 MHz for all systems except SECAM L' (33.9 MHz).

A quasi-split audio system is used. Separate surface-wave filters (SAW) are required. [1700], [1701] for video, [1702] for audio. [1700] is switched into the signal path for DK/I-SECAM L/L' reception, if the signal SAWS is "high". In this case the switches [7701], [7702] are open and the diode [6700] is conducting. [1701] is switched into the signal path for BG reception, if the signal SAWS is "low". Then the switch [7708] is open and the diode [6701] is conducting. For DK/I-SECAM L' reception, an additional circuit for suppressing the adjacent channel audio carrier is provided, which is set using coil [5702] to maximum suppression at 40.4MHz.

IF Demodulator

TDA 9818

The IF signal from the tuner is processed by the demodulator IC TDA 9818 [7703]. The signal PSS to pin3 switches between demodulation of positive SECAM or negative PAL modulated video carriers. A QSS-audio-IF signal SIF1 is generated for demodulation in the sound processor [7600]. The audio-IF carrier is selected in the audio SAW filter [1702]. This filter is switched for SECAM L'. If the signal SB1 is "high", the switch [7707] is closed and the diode [6702] is not conducting. For all other standards the diode [6702] is conducting and the switch [7707] is open. The output signal from this SAW filter is first processed in the TDA 9818. Audio carriers are converted from the tuner IF level into the audio IF position and further processed in the audio demodulator [7600]. The AFC coil [5703] on the TDA 9818 is adjusted so that when a frequency of 38.90 MHz is supplied to the IF output of the tuner, the AFC voltage on pin 17 of the TDA 9818 is 2.5V. The setting of the picture carrier frequency for SECAM L in the TDA 9818 is achieved by connecting pin 7 of the IC via a resistor [3702] to earth. The switch [7700] and the signal SB1 "high" do this. The HF-AGC is set using the AGC controller [3707] so that, with a sufficiently large antenna input signal (74 dBV), the voltage at the IF output of the tuner [1705] pin 11 is 500 mVpp. This setting must be carried out, when the audio carrier is switched off. The demodulated video signal appears on pin 16 [7703]. The demodulator AGC voltage at pin4 is used to determine the antenna signal strength after a buffer [7705] with the signal AGC_MUTE. In the opposite direction this line may be used to mute the demodulator to avoid cross talk in all cases, where the tuner signal is not needed. In this case a „high“ signal is sent via AGC_MUTE and the conducting diode [6703] to pin4. The video trap [1703] reduces adjacent channel video and sound carrier remainders in the video for BG standards. For all other standards the switch [7704] and signal TS "low" bypass the trap. In this cases the selectivity of the SAW filter [1700] is sufficient. A frequency response correction is achieved by the inductance [5009] for not BG standards. This correction is not

preferred for SECAM L' and therefore shorts circuited by [7709], if the signal SB1 is "high". The demodulated video signal VFV is available after the buffer and limiting stage for noise peaks [7706]. The FM-PLL demodulator function of TDA 9818 is not used and deactivated by the resistor [3726].

Audio Demodulator

Sound processor MSP 3415G

The MSP 3415G [7600] is a multistandard sound processor which can demodulate FM Mono/Stereo, NICAM and AM signals. The incoming signal is first controlled and then digitised. The digital signal is then demodulated in 2 separate channels. In the first MSP channel, FM and NICAM (B/G/I/D/K) are demodulated, whereas in the second MSP channel, FM and are demodulated again (NICAM L corresponds to NICAM B/G). These demodulated signals are selected digitally in the I/O and switched to the D/A converter on the outputs. Amplitude and bandwidth of the demodulated audio signals can be determined in the MSP using the corresponding commands via the I2C bus. The audio signal from the tuner is available at the pins 30 AFER and 31 AFEL.

9.3.9 Input/Output Video-Routing (Europe-Version)

General Description:

The complete Video- I/O-switching is basically realised by the I/O switch STV6410A. It is controlled via IIC-Bus-0 (SDA/SCL) by the all in one C on the analogue board. The STV 6410 has three YCVBS switches, three chroma switches and one RGB switch. All switches have 6-dB amplification on the outputs. The YCVBS inputs have bottom clamp, the chroma inputs have average clamp, and the RGB inputs have bottom clamp circuits at the inputs. The R/C inputs can be switched to average clamp for chroma signals via I2C bus.

The IC has also one slow blanking monitor and one fast blanking switch for fast RGB insertion (see detailed description in chapter 1.5). Two pre-selectors BA 7652 are additionally used: One for switching between Rear CVBS, Y- Rear and Front, the second for switching between Chroma- Rear and Front signal. Both pre-selectors are controlled via IS1 and IS2 from the analogue board C.

CVBS Signals:

There are four CVBS input connection possibilities: Front chinch (E6), Rear Chinch (E4), Scart 1 (E1) and Scart 2 (E2). Rear Chinch In is routed via the pre selector BA 7652; the other signals are connected direct to the STV 6410. The selected CVBS signal is routed to Rear Chinch Out (via BA 7660, 6dB amplification, 75 Ohm driver) and to Scart 1. Independent of the input signal quality (CVBS, S-Video or RGB) the digital board supplies also S-Video and RGB signals to the corresponding socket.

S-Video Signals:

There are also four S-Video input connection possibilities: Front In (E5), Rear In (E3), Scart 1 and Scart 2. For S-Video from Scart this option has to be switched on in the OSD menu. The pre-selectors and the STV 6410 do the signal selection (for detailed routing see overview). Also the video quality will be S-Video, the digital board supplies also CVBS to the corresponding sockets. The S-Video signal that is coming from the digital board is routed via BA 7660 (6-dB amplification and 75-Ohm driver) to the S-Video Rear Out socket.

RGB Signals:

The Scart 2 RGB input signal (Decoder socket) is connected to the RGB switch of STV 6410 and to the digital board in parallel. The RGB from Scart 2 is routed to Scart 1 in low power standby mode. The direct connection (not via STV 6410) is for loop through and REC. The RGB signal, which is coming from the digital board, is connected to the RGB encoder input of the STV 6410 and is routed to Scart 1 in all other modes.

As the Scart-connection can carry either RGB- or Y/C-signals it is necessary to define the available and selected signal-property. While Pin15 of Scart (Red or Chroma-upstream) is fully handled via STV6410A the Pin7 (Blue or Chroma-downstream) has to be extra set.

- Scart1: Pin42 of C (SC1YC_H-line):
 - Low (Blue-Out on SC1
 - High (Chroma-In on SC1
- Scart2: Pin41 of C (SC2RGB_H-line):
 - Low (Chroma-Out on SC2
 - High (Blue-In on SC2

Detection of Status-Information

Pin-8 (Slow-Blank):

Level-detection of Pin-8 (Scart-1 and -2) is realised by using STV6410A. It can be readout via IIC-Bus by the CC-C. To obtain the status of Scart1-Pin8, Bit 0 & 1 of register 06h must be set to 0 (Input-mode). The corresponding bits for verification of Scart2-Pin8-status are set to input-mode as default.

Meaning of Read-Register-Bits:

- Bit 7 & 6: not used
- Bit 5 & 4: Status Scart-2/Pin8:
 - 0 1 Low-level
 - 1 0 Medium-level (16:9)
 - 1 1 High-level (4:3)
- Bit 3 & 2: not used
- Bit 1 & 0: Status Scart-1/Pin8:
 - 0 1 Low-level
 - 1 0 Medium-level (16:9)
 - 1 1 High-level (4:3)

Pin-16 (Fast Blank):

Only the status/level of Scart-2/Pin16 must be detected; this is realised by using PortC3/AIN14 (Pin25) of the CC-C as an Analogue-input.

- ADC-value lower or equal 24h (Pin16 low (no RGB-signals)
- ADC-value greater 24h (Pin16 high (RGB present on Scart-2)

To avoid misdetection a "software-integration" (result is first valid if it was 3-times the same) must be implemented, determination has to be done approx. every 47msec (no multiple of V-sync).

WSS on Y/C-Plug:

Picture-Ratio-Information (16:9 or 4:3) on S/H-S-connections is coded via the average DC-level of the Chroma-signal-line, detection is realised by using an analogue-input-port of the CC-C.

- ADC- value lower or equal 40h (4:3-picture-ratio delivered
- ADC-value greater 40h (16:9-picture-ratio available on plug

Y/C-Rear is determined via Port40/AIN3 (Pin14) of CC (WSRI-line) and Port41/AIN4 (Pin15) is used for Y/C-Front (WSFI-line).

Generation of Status-Information

Pin-8 (Slow Blank):

Only on Scart-1 the Slow-Blank-Status (Level of Pin8) must be created, which is done via IIC-Bus-register 06h (Bits 0 & 1) of the STV6410A.

Pin-16 (Fast Blank):

Only the status/level of Pin16-Scart1 must be controlled; this is realised by using the FB-switch-capabilities of the STV6410A, which are set via IIC-Bus-register 04h (bits 4 & 5).

WSS on Y/C-Plug:

The appropriate DC-level on Chroma-signal-line for Y/C-Rear-Out is produced via Port57 (Pin10) of the CC (WSRO-line).

- 4:3 - Picture-ratio supported on Y/C-Plug Port57 set to 0

- 16:9 - Picture-ratio supported on Y/C-Plug: Port57 set to 1

9.3.10 Audio Routing Analogue board (Europe / Nafta)

General Description:

The Audio- I/O switching is realised by the STV6410 I/O switch. By I²C Bus (SDA-0/SCL-0) it is possible to control all the Audio in- and outputs (for detailed Information we refer to the STV6410 routing overview).

Analog audio coming from DV-Board and second rear Cinch input is routed via MSP3415 to the STV 6410. After selecting the audio source via STV 6410, the signal must be transformed into the digital domain. For this, the UDA 1360TS (ADC) is responsible. An input-voltage of up to 2Vrms can be handled from the IC's. For further processing, the UDA 1360TS (ADC) delivers the data-in I²S format to the digital-board. After a certain delay the (processed) data come back from the digital board to the UDA 1328 (DAC). The UDA 1328 (DAC) transforms the I²S data back into the analog domain and feeds the signals direct to the MC33078 (OPV). From the MC33078 (OPV) the signals are delivered back to the STV 6410 and also direct to the 2nd rear out Cinch. The other outputs (Scart, Cinch) are supported by the STV 6410.

Detailed Description STV 6410:

The STV 6410 is an I²C bus controlled audio and video switch matrix, which is able to handle audio input signals up to 2 Vrms. The used outputs are equipped with internal level adjustment possibility. Low distortion and very good channel separation is a typical peculiarity of this IC. The output resistance is very low and the frequency bandwidth is up to 50 kHz.

Detailed Description UDA 1360:

The UDA 1360TS is a stereo Analog-to-Digital Converter employing bitstream conversion techniques.

The UDA supports the I²S-bus data format and the MSB-justified data format with word lengths of up to 20 bits. The IC supports also 2Vrms input signals and is designed for 3V3 supply voltage.

The device is able to handle system clocks of 256fs and 384fs. Typical THD+N at 0dB is -85dB and a S/N performance up to 97dB is possible.

Detailed Description UDA 1328:

The UDA1328 is a 6 channel DAC employing bitstream conversion techniques, which can be used either in L3 microcontroller mode or in static pin mode.

The UDA 1328 supports the I²S-bus data format with word lengths of up to 24 bits.

Digital sound features can be controlled with the L3 interface.

System clock can be set to 256fs or 384fs.

The Device also provides 2 high quality differential outputs.

Typical THD+N at 0dB is -95dB and a S/N of up to 106dB is possible.

Supply voltage is 3V3.

Detailed Description MC 33078:

The MC33078 is a dual operational amplifier for audio applications.

It offers low voltage noise (4,5nV/√Hz) and high frequency performances (15MHz Gain Bandwidth product, 7V/s slew rate).

In addition the MC33078 has a very low distortion (0,002%).

BLOCK DIAGRAM VIDEO IN/OUT EUROPE-VERSION

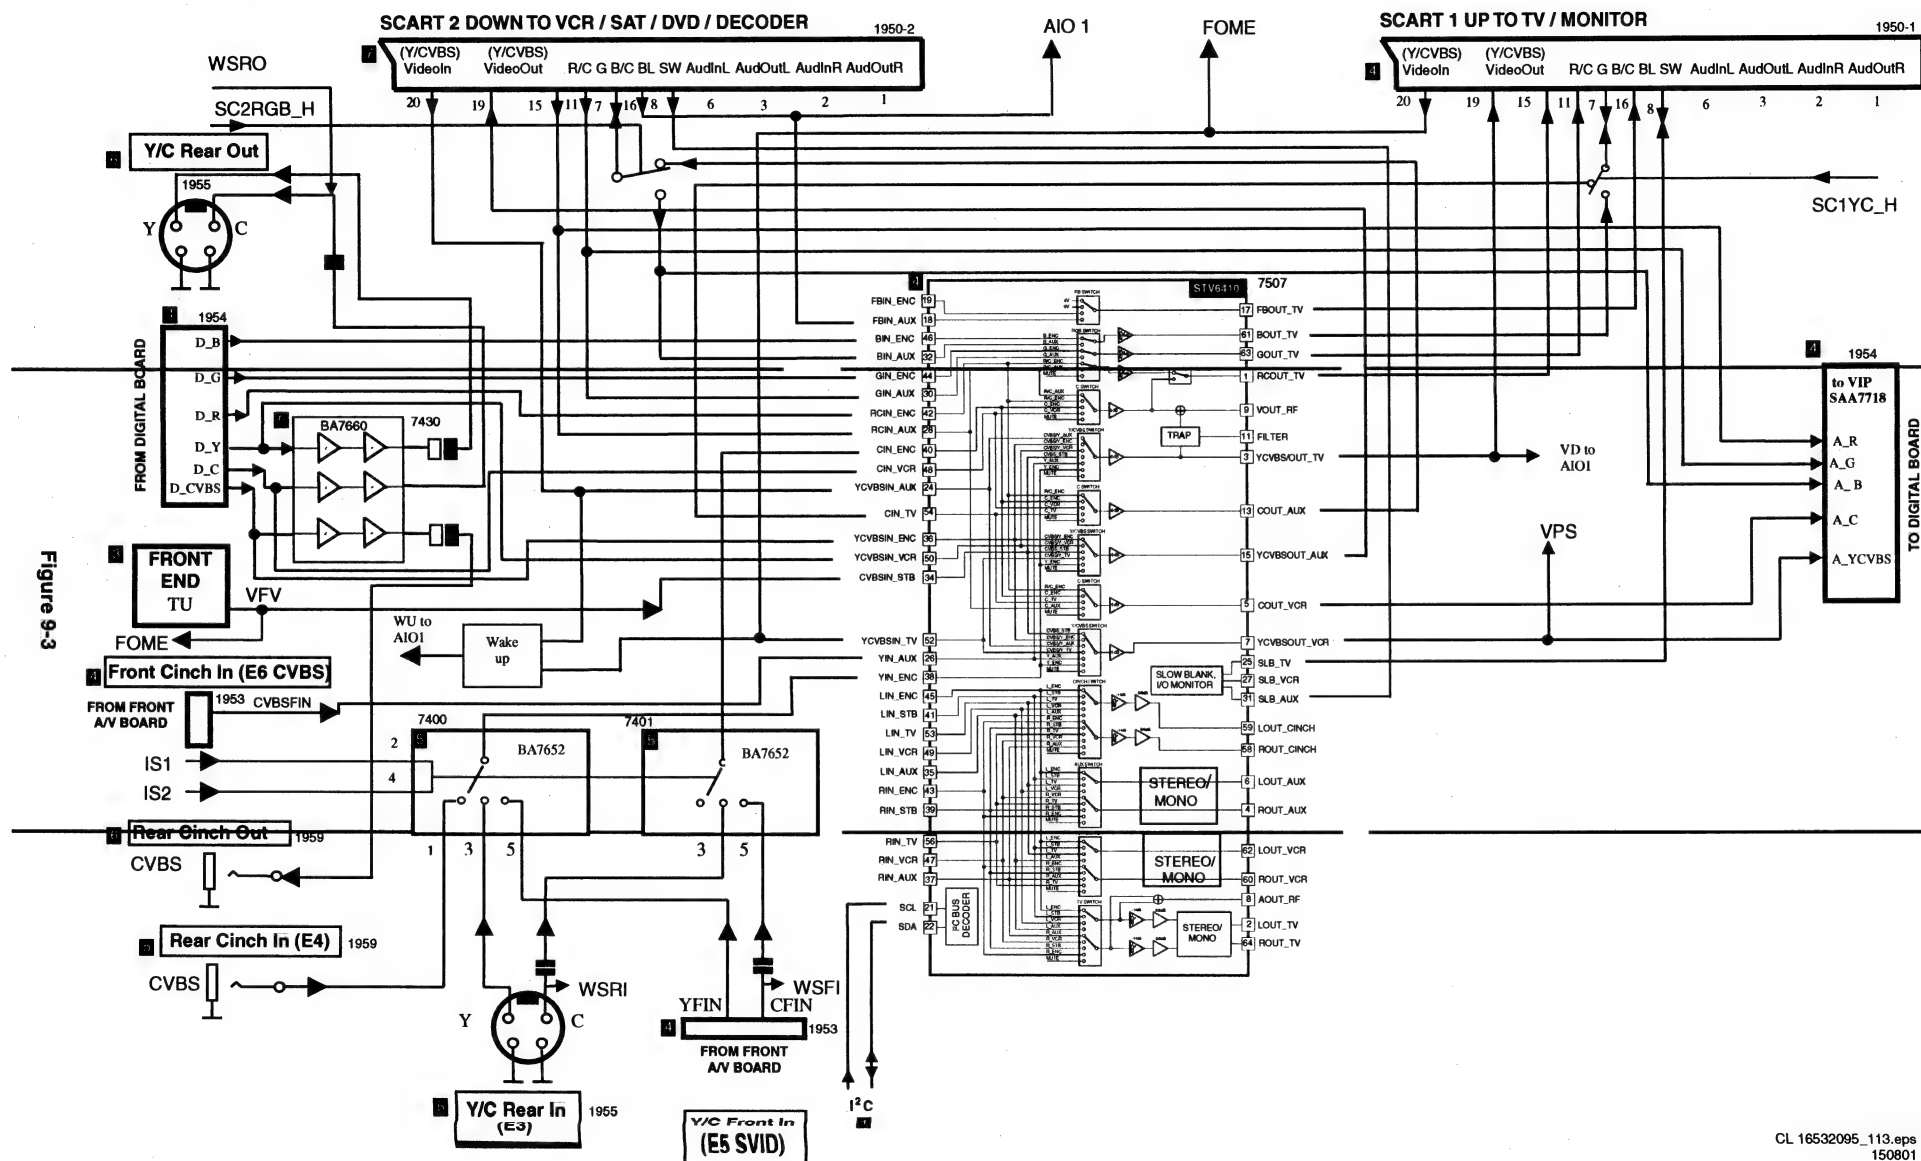

Figure 9-3

BLOCK DIAGRAM AUDIO IN/OUT EUROPE-VERSION

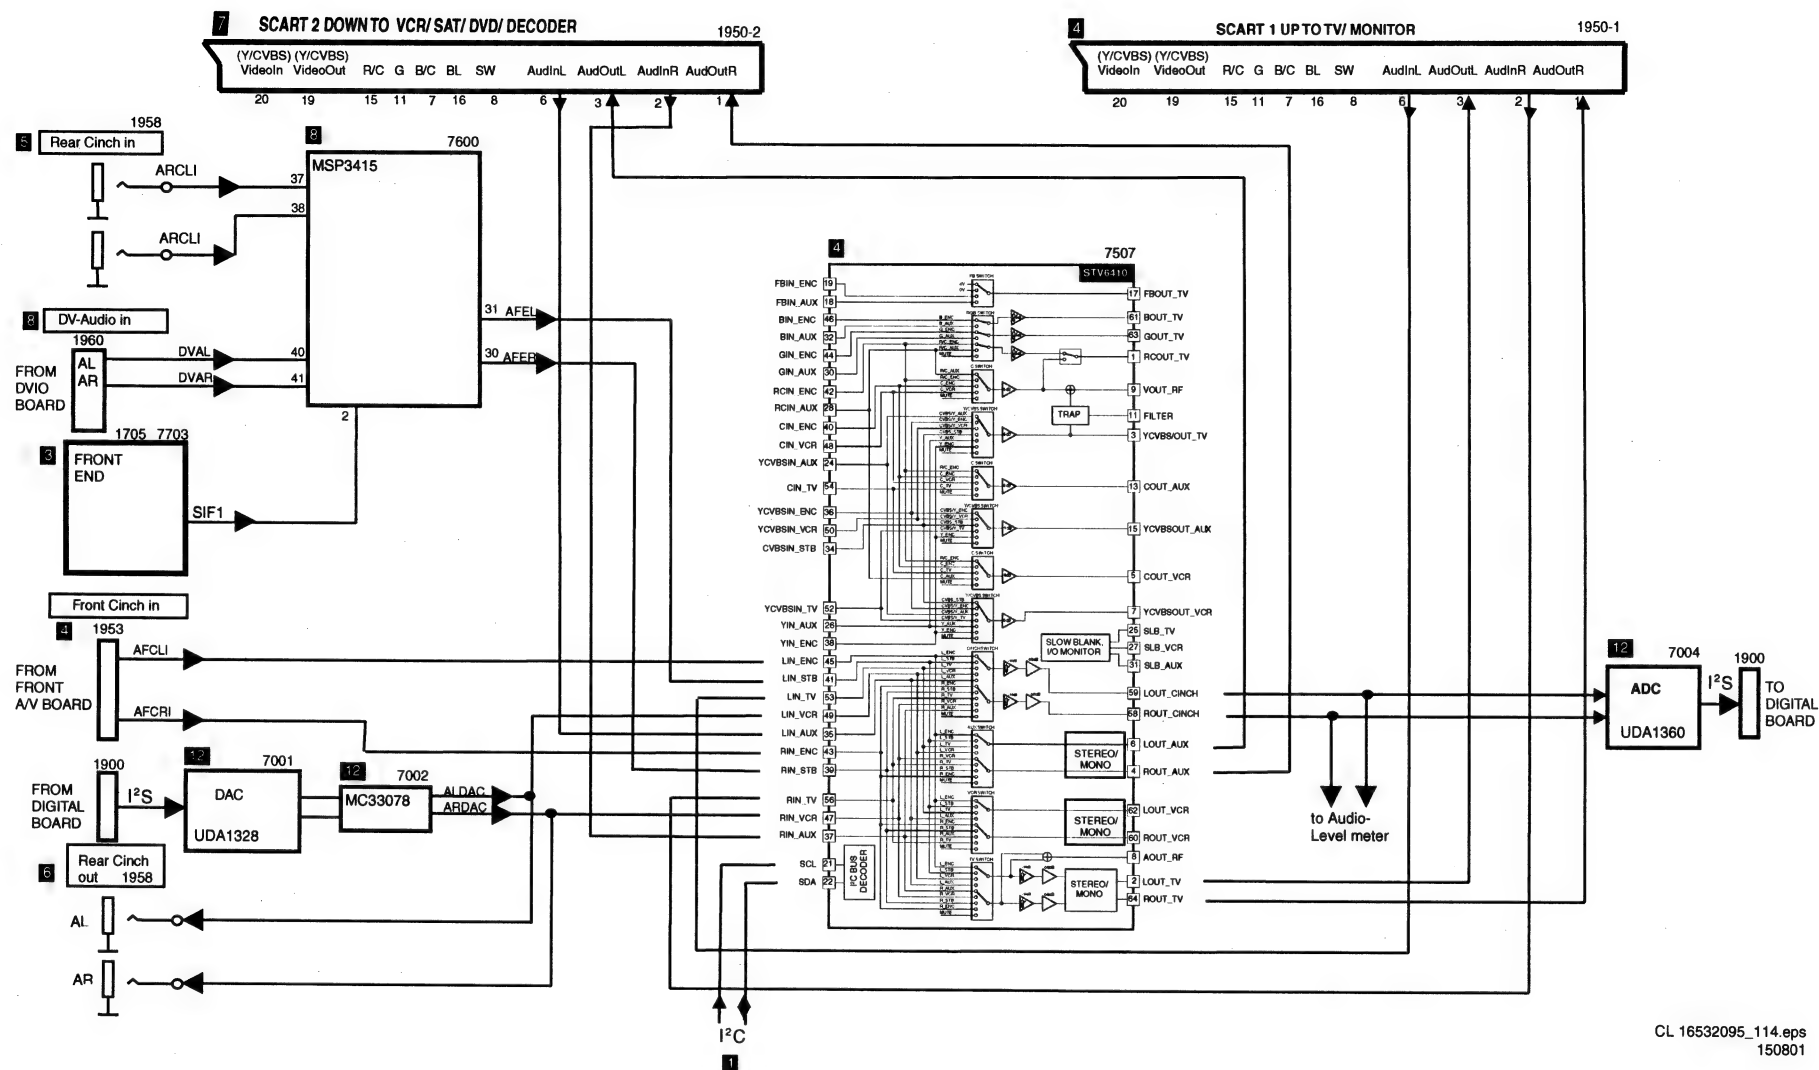

Figure 9-4

9.4 Analog Board Nafta version

9.4.1 Microprocessor TMP93C071F

The microcontroller „AIO“ TMP93C071F is a 16bit microcontroller with internal ROM and 8kB RAM. It includes the following functions:

- A/D converters
- composite sync input
- I²C bus interface

The following connection to the mains, a positive pulse on the reset input on the P is generated by the reset-IC TL7705 (Pos.7900).

The system clock is generated with the 20MHz quartz (Pos. 1994).

9.4.2 Bus Systems

The communication between the P and the other functional groups is via the I²C-bus (SDA, SCL). The clock rate is approx. 95kHz.

Functional groups on the I²C bus:

- E²PROM ST24E16 (Pos. 7815)
- Tuner (Pos. 1705)
- Matrix-switch STV6410 (Pos. 7507)
- Audio IC / MSP (Pos. 7600)
- Display board (Pos. 1987)

9.4.3 E²PROM

The E²PROM ST24E16 (Pos. 7815) is an electric erasable and writeable, non-volatile memory. The E²PROM stores data specific to the device, such as the AFC-reference value, clock-correction-factor, etc. The data is accessed by the P via the I²C-bus.

9.4.4 FOME

The FOME (Follow Me) -circuit compares the video signal coming from the tuner and the one coming from the Scart-plug 1. If the video-signals are identical the output of the FOME-circuit is low.

9.4.5 Fan Control

The fan control circuit is necessary to control the speed of the cabinet fan (Pos. 1984) according to the requirements in temperature and noise. The temperature is measured via an NTC on the display board (Pos. 3145). When the temperature is lower than 25°C the fan-voltage is approx. 5V and will reach approx. 10V at a temperature of 40°C. It is also possible to switch off the fan via the control line ION_FAN. The circuit generates also two control-signals: TEMP goes to the P and BE_FAN is the control-line for the basic engine fan.

9.4.6 Power Supply

The 5SW and 8SW supply are switched off in case of Stby from the P via the ISTBY-line. This is possible for power-save. The ISTBY-line must be low in case of STBY. There is also a „power fail“ circuit on the PS-schematic which is necessary to mute AUDIO when IPFAIL is low.

9.4.7 Front End (TU, AP Part)

The front end comprises the following parts:

- Tuner [1705]
- IF amplifier & video demodulator IC TDA 9817 [7703]
- Sound processor MSP3445G [7600]

IF Selection

The IF frequency of the video carrier is 45.75 MHz. A quasi-split audio system is used. Separate surface-wave filters (SAW) are required. [1701] for video, [1702] for audio.

IF Demodulator

TDA 9817

The IF signal from the tuner is processed by the demodulator IC TDA 9817 [7703]. A QSS-audio-IF signal SIF1 is generated for demodulation in the sound processor [7600]. Audio carriers are converted from the tuner IF level into the audio IF position and further processed in the audio demodulator [7600]. The AFC coil [5703] on the TDA 9817 is adjusted so that when a frequency of 45.75 MHz is supplied to the IF output of the tuner, the AFC voltage on pin 17 of the TDA 9817 is 2.5V. The HF-AGC is set using the AGC controller [3707] so that, with a sufficiently large antenna input signal (74 dBV) the voltage at the IF output of the tuner [1705] pin 11 is 500 mVpp. This setting must be carried out, when the audio carrier is switched off. The demodulated video signal appears on pin 16 [7703]. The demodulator AGC voltage at pin4 is used to determine the antenna signal strength after a buffer [7705] with the signal AGC_MUTE. In the opposite direction this line may be used to mute the demodulator to avoid crosstalk in all cases, where the tuner signal is not needed. In this case a „high“ signal is sent via AGC_MUTE and the conducting diode [6703] to pin4. The video trap [1703] reduces adjacent channel video and sound carrier remainders in the video. The demodulated video signal VV is available after the buffer and limiter stage for noise peaks [7706]. The FM-PLL demodulator function of TDA 9817 is not used and deactivated by the resistor [3726].

Audio Demodulator

Sound processor MSP 3445G

The MSP 3445G [7600] is a NTSC sound processor. Amplitude and bandwidth of the demodulated audio signals can be determined in the MSP using the corresponding commands via the I2C bus. The audio signal from the tuner is available at the pins 30 AFER and 31 AFEL.

9.4.8 Video-Routing (Nafta Version)

General Description:

The complete Video- I/O-switching is basically realised by the I/O switch STV6410A, which is controlled via IIC-Bus-0 (SDA/ SCL) by the all in one C on the analogue board. The STV 6410 has three YCVBS, three chroma, and one RGB switch which is not used in the Nafta I/O. All switches have 6-dB amplification on the outputs. The YCVBS inputs have bottom clamp, the chroma inputs have average clamp, and the RGB switch has bottom clamp circuits at the inputs. The R/C inputs can be switched to average clamp for chroma signals via I2C bus. Two pre-selectors BA 7652 are additionally used: One for switching between Y- Rear and Front, the second for switching between Chroma- Rear and Front signal. Both pre-selectors are controlled via IS1 and IS2 from the analogue board C.

CVBS Signals:

There are two CVBS input connection possibilities: Front chinch (E5) and Rear Chinch In (E3). Both CVBS sources are connected direct to the STV 6410 and routed to Rear Out 1 and Rear Out 2 via the 75-Ohm driver BA 7623. Both CVBS output sockets are connected to BA 7623 in parallel. Independent of the input signal quality (CVBS, S-Video or Y/UV) the digital board supplies also S-Video and Y/UV signals to the corresponding sockets.

S-Video Signals:

There are also two S-Video input connection possibilities: Front (E4) and Rear (E2) S-Video In which are connected to the pre-selector IC's BA 7652. One is used for Y, the other for Chroma

switching. The output of the pre-selector switches is connected to the STV 6410, and then the signal is routed via the 75-Ohm driver BA 7623 to the Rear Out S-Video socket. Also the video quality will be S-Video, the digital board supplies also CVBS and Y/UV to the corresponding sockets.

Y/UV Signals:

The Y/UV In signal is routed direct to the digital board, there is no Y/UV IN -> Y/UV Out loop through in low power standby. As the digital board supplies only RGB signals, a RGB Y/UV matrix is used. This matrix consists of the operational amplifier TSH95 which generates the U and V signals according the formulas: $2U=B-0,338R-0,661G$, $2V=R-0,838G-0,161B$. Then the signals are routed to the UV Output sockets via the 75-Ohm driver BA 7623. The corresponding Y signal is coming from the digital board via the STV 6410. The 75 Ohm Y socket is driven by the 75-Ohm driver BA 7623 and finally connected to the of the Y/UV Output.

Detection of Status-Information

WSS on Y/C-Plug:

- Picture-Ratio-Information (16:9 or 4:3) on SVHS-connections is coded via the average DC-level of the Chroma-signal-line, detection is realised by using an analogue-input-port of the CC-C.
- ADC- value lower or equal 40h (4:3-picture-ratio delivered
- ADC-value greater 40h (16:9-picture-ratio available on plug
- Y/C-Rear is determined via Port40/AIN3 (Pin14) of CC (WSRI-line) and Port41/AIN4 (Pin15) is used for Y/C-Front (WSFI-line).

Generation of Status-Information

WSS on Y/C-Plug:

The appropriate DC-level on Chroma-signal-line for Y/C-Rear-Out is produced via Port57 (Pin10) of the CC-C (WSRO-line).

- 4:3 - Picture-ratio supported on Y/C-Plug: Port57 set to 0
- 16:9 - Picture-ratio supported on Y/C-Plug: Port57 set to 1

9.4.9 Audio routing Analogue board (Europe / Nafta)

General Description:

The Audio- I/O switching is realised by the STV6410 I/O switch. By I²C Bus (SDA-0/SCL-0) it is possible to control all the Audio in- and outputs (for detailed Information we refer to the STV6410 routing overview).

Analog audio coming from DV-Board and second rear Cinch input is routed via MSP3415 to the STV 6410. After selecting the audio source via STV 6410, the signal must be transformed into the digital domain. For this, the UDA 1360TS (ADC) is responsible. An input-voltage of up to 2Vrms can be handled from the IC's. For further processing, the UDA 1360TS (ADC) delivers the data-in I²S format to the digital-board. After a certain delay the (processed) data come back from the digital board to the UDA 1328 (DAC). The UDA 1328 (DAC) transforms the I²S data back into the analog domain and feeds the signals direct to the MC33078 (OPV). From the MC33078 (OPV) the signals are delivered back to the STV 6410 and also direct to the 2nd rear out Cinch. The other outputs (Scart, Cinch) are supported by the STV 6410.

Detailed Description STV 6410:

The STV 6410 is an I²C bus controlled audio and video switch matrix, which is able to handle audio input signals up to 2 Vrms. The used outputs are equipped with internal level adjustment possibility. Low distortion and very good channel separation is a typical peculiarity of this IC. The output resistance is very low and the frequency bandwidth is up to 50 kHz.

Detailed Description UDA 1360:

The UDA 1360TS is a stereo Analog-to-Digital Converter employing bitstream conversion techniques.

The UDA supports the I²S-bus data format and the MSB-justified data format with word lengths of up to 20 bits. The IC supports also 2Vrms input signals and is designed for 3V3 supply voltage.

The device is able to handle system clocks of 256fs and 384fs.

Typical THD+N at 0dB is -85dB and a S/N performance up to 97dB is possible.

Detailed Description UDA 1328:

The UDA1328 is a 6 channel DAC employing bitstream conversion techniques, which can be used either in L3 microcontroller mode or in static pin mode.

The UDA 1328 supports the I²S-bus data format with word lengths of up to 24 bits.

Digital sound features can be controlled with the L3 interface.

System clock can be set to 256fs or 384fs.

The Device also provides 2 high quality differential outputs. Typical THD+N at 0dB is -95dB and a S/N of up to 106dB is possible.

Supply voltage is 3V3.

Detailed Description MC 33078:

The MC33078 is a dual operational amplifier for audio applications.

It offers low voltage noise (4,5nV/√Hz) and high frequency performances (15MHz Gain Bandwidth product, 7V/s slew rate).

In addition the MC33078 has a very low distortion (0,002%).

9.5 Digital Board

9.5.1 Record Mode

Video Part

Analog Video input signals CVBS, YC and UV(RGB for EURO and YUV for USA) are routed via the analog board to connector 1601 and sent to IC7500 SAA7118 (Video Input Processor). Digital video input signals (DV_IN_DATA(7:0)) are sent from the DIVIO board through the connector 1603 and further also to IC7500.

IC7500 (VIP) encodes the analog video to digital video and processes the digital video to a digital video stream (CCIR656 format). This output stream (VIP_YUV[7:0]) goes to IC7403 SAA6752H (EMPRESS) and to IC7100 Versatile Stream Manager. The latter uses the data for VBI (vertical blanking interval) extraction.

IC7403 (EMPRESS) encodes the digital video stream into a MPEG2 video stream that is fed to IC7100 (VSM).

Audio Part

I2S audio are sent from the analog board to IC7403 EMPRESS via connector 1602. The EMPRESS compresses I2S audio data into an AC3 audio stream which is fed to IC7100 (VSM).

Front-End I2S

IC7100 (VSM) interfaces directly to the different hardware modules such as Basic Engine, EMPRESS IC7403, MPEG decoder IC7200 (Sti5508) and buffers the data streams that are coming from or going to these hardware modules. In IC7100 (VSM), the video MPEG2 stream and the audio AC3 stream are multiplexed into a I2S packetized stream. The serial data are sent to the Basic Engine to be recorded.

Loop-Through

The multiplexed audio and video stream in the VSM is fed back via the parallel front-end interface to IC7200 (Sti5508). This IC decodes the MPEG stream into analog video and I2S audio. The video and audio signals are routed to the analog board via connectors 1601 and 1602. During recording, the recorded signal is present at the outputs of the analog board.

9.5.2 Playback Mode

During playback, the serial data from the Basic Engine is going directly to the Sti5505 via the serial front-end I2S interface. The Sti5508 is a MPEG & Audio/video decoder and has the following outputs:

- To the analog board:
 - analog video RGB, YC, CVBS
 - I2S audio (PCM format)
 - SPDIF audio (digital audio output)
- To the Progressive scan board:
 - digital video YC(7:0).

9.5.3 S2B Interface

The S2B interface between the VSM (IC7100) and the Servo processor MACE3 controls the Basic Engine during record and playback mode.

9.5.4 System Clock

System clocks(27MHz) of VSM, Sti5508, EMPRESS and Progressive Scan are generated by oscillator 7906

9.5.5 Audio Clock

During record mode, the audio clock ACLK_EMPRESS is generated by the EMPRESS IC 7403, filtered by the PLL IC 7102 and set to the VSM IC7100 as ACC_CLK_OSC. In the VSM the following clocks are generated:

- Audio decoder clock: AD_ACLK
- Audio encoder bit clock: AE_BCLK_VSM
- Audio encoder word clock: AE_WCL_VSM

AD_CLK is sent as AE_ACLK to the ADC IC on the analogue board and via buffer 7202 as AD_ACLK to the DAC IC on the analogue board. It is also connected to the Sti5508 and used to generate internally the necessary audio clocks for audio PCM. AE_BCLK_VSM and AE_WCLK_VSM are sent to the EMPRESS and further as AE_WCLK and AE_BCLK to the analogue board.

During playback mode, the audio clock AD_ACLK is generated by the MPEG AV DECODER Sti5508 (IC 7200) and sent to the analogue board. Buffer 7202 is in tri-state and blocks AD_ACLK to avoid interference with AE_ACLK.

9.5.6 On/Off

The digital board is not powered in standby mode. Control signal ION, coming from the analog board, will enable the PSU and power the digital board.

- ION = High: the digital board is in powered down standby mode
- ION = Low: the power supply to the digital board is enabled

9.5.7 Reset

Control signal IRESET_DIG, controlled by the microprocessor on the analog board is sent to the RESET LOGIC circuit.

- IRESET_DIG = Low in standby mode
- IRESET_DIG = High: the whole system is reset and the Digital board is waked up.

9.5.8 I2C Bus

Sti5508 is master of the I2C bus. The following IC's are controlled by the I2C bus:

- IC7201 NVRAM
- IC7403 EMPRESS
- IC7500 VIP
- IC7700 FLI2200 Video Deinterlacer Line Doubler
- IC7801 ADV7196 Video Denc

9.5.9 EMI Bus

The following IC's are connected to the External Memory Interface bus (EMI) which functions as system bus:

- IC7301 and 7302: Flash memories which contain the application and diagnostic software
- IC7100: VSM
- IC7200: MPEG AV Decoder

9.5.10 Progressive Scan

Description

The progressive scan part is integrated in the Digital Board and built around the SAGE Fi2200 de-interlacer / line doubler (7701). This I2C controlled de-interlacer uses a 64Mbit SDRAM (32bit x 2M) to perform high quality deinterlacing (meshing). The de-interlacer gets his digital YUV input data from the STi5508 (7200). The format of the digital YUV input to the SAGE is CCIR656 with separated Hsync, Vsync and odd/even signal running on 27Mhz.

Because the STi5508 doesn't have a Vsync output the odd/even output of this IC has to be translated to a Vsync signal. Some glue logic has been added to extract the vertical sync. The glue logic circuit consists of Flip-Flop IC 74HC74D (7701) and EXOR 74LVC86 (7702). The next diagram shows how the vertical sync is extracted.

Vertical Sync

Figure 9-8

The output of the de-interlacer (4:4:4 progressive video) is fed to the Analog Devices ADV71967 MacroVision compliant DENC (7801).

The YUV current output of the DENC is fed via a low pass filter to the single supply output opamps AD8061/8062 (7802-7803). The analog video is fed via a 7 poled flex to the analog board where the YUV 2FH cinch connectors are located.

9.6 Divio 1.8 Board

9.6.1 Short Description of the Module:

The DVIO Module is a decoder for DV streams. Input is a stream from a DV-camcorder via IEEE1394. Outputs are CCIR656 Video and Analog audio (L+R). A serial control interface is present.

The following picture shows the location of the DVIO Module inside the DVDR set.

Description DIVIO Module

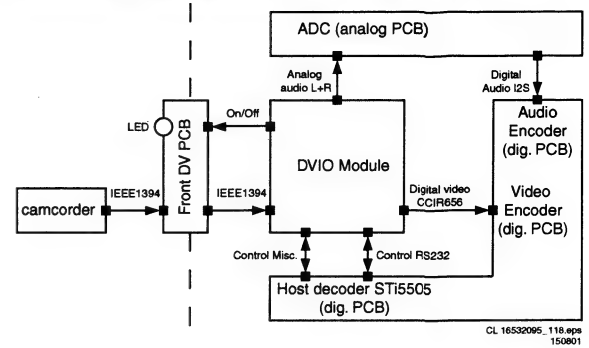

Figure 9-9

9.6.2 Block Diagram

Block Diagram DVIO1.8

TR03022_001
090802

Figure 9-10

9.6.3 Functional Description

The DVIO module consists of the following blocks (see blockdiagram):

1. IEEE1394 Interface
 - uPD72852 (7400) (Phy)
 - uPD72893 (7431) (Link part)
2. Micro-controller
 - uPD78F0988 (7802)
 - Voltage regulator LM2931 for generation of 10V programming voltage (7801)
3. Reset-circuitry
 - Power-on reset
 - Reset pulse-shortener
4. DV-Decoder
 - uPD72893 (7431) (Codec part)
 - 16MBit SDRAM (7430)
 - optional Flash-Memory M29W800AT for Firmware-Update of uPD72893 (7432)
5. Clocking & Audio PLL
 - Clock oscillator FXO-31FT (7601)
 - Audio-PLL: Voltage controlled oscillator BA7082F (7604), clock generator BU2288FV (7605), and clock divider 74LV74 (7606-A)
6. Audio Format adaption (MSB justified -> I2S), option
 - 74LV74 (7507-A, -B)
7. Audio & Video output
 - Audio DAC UDA1334ATS(7602)
 - Clock delay(7500)
 - Tristate buffer(7505)

IEEE1394 Interface

The 1394 interface consists of a uPD72852 physical layer and a uPD72893 link layer IC (uPD72893 integrated also DV-Decoder).

It has the following features:

- S400 operation (400 megabit per second)
- Two i.Link ports (4 pin), only one used
- AV link port

Micro-Controller

The uPD78F0988 processor has following extra features:

- 60 kilobyte of flash memory as program memory
- 2 kilobyte of internal data memory
- watchdog timer
- On board ISP(In-System-Programming) functionality

ISP

By use of In-System-Programming, it is possible to update the software of the DVIO board that is in the uPD78F0988. ISP can be made active by resetting the processor and keeping the ISPN pin low during reset. During ISP, the ISPN signal on the board has to be kept low. A programming voltage of 10V is activated by the uPD78F0988 itself at the Vpp pin before programming procedure starts. When the ISP mode is active, the new program can be sent to the microprocessor through the serial port.

Reset-circuitry

The reset-circuitry consists of two parts.

First part (around transistor 7803) generates a reset pulse when the board is powered up.

Second part (around transistors 7804 & 7805) acts as a reset-pulse shortener, i.e. a short reset pulse (4ms) is generated from the input signal RESETn which is much longer (usually 100ms). This is required to ensure correct operation of the Micro-controller after booting-up when RESETn is again deactivated.

DV-Decoder

The uPD72893 decodes the stream into video data in 656 format and audio data in I2S format.

The microprocessor has the ability to read the status registers of the uPD72893. By reading these registers, extra data from the DV stream, that is not decoded into audio or video, can be sent to the digital board using pin TXD of the serial interface.

This data includes time stamp and some more.

Clocking and Audio PLL

The FXO-31FT generates the free-running 27MHz system clock. Video part of input DV-stream is in the uPD72893 adapted to the local 27MHz clock domain (skip, repeat frame). Because audio clock (11.2896Mz [fs=44.1kHz] or 12.288MHz [fs=32kHz, 48kHz]).

The uPD72893 integrates the phase comparator that drives the VCO BA7082F to a nominal frequency of 27MHz which in turn is converted by BU2288FV and 74LV74 to 11.2896MHz or 12.288MHz, respectively.

The uPD72893 controls directly the frequency ratio of the BU2288FV.

Audio Format adaptation (MSB justified -> I2S), option

Due to a bug in 1st version of uPD72893 digital audio output is not correct in I2S mode when in 32kHz operation. As a workaround uPD72893 is generally configured in MSB justified mode and conversion to I2S mode is done externally via a 74LV74 device.

Can be disabled with later versions of uPD72893.

Audio & Video Output

The audio I2S data are sent to audio DAC UDA1334. Analog audio left and right signals are connected to the analog board. The tri-state buffer enables the digital video stream to the Video Input Processor on the digital board when the DV source is selected.

The clock delay synchronizes the AV clock with the AV data at the output.

9.7 IC’s Analog Board

9.7.1 IC7001: UDA1328T

Multi-channel filter DAC

UDA1328T

1 FEATURES

1.1 General

- 2.7 to 3.6 V power supply
- 5 V tolerant TTL compatible inputs
- Selectable control via L3 microcontroller interface or via static pin control
- Multi-channel integrated digital filter plus non-inverting Digital-to-Analog Converter (DAC)
- Supports sample frequencies between 5 and 100 kHz
- Digital silence detection (output)
- Slave mode only applications
- No analog post filtering required for DAC
- Easy application.

1.2 Multiple format input interface

- I²S-bus, MSB-justified and LSB-justified format compatible (in L3 mode)
- I²S-bus and LSB-justified format compatible
- 1f_s input format data rate.

1.3 Multi-channel DAC

- 6-channel DAC with power on/off control
- Digital logarithmic volume control via L3; volume can be set for each of the channels individually
- Digital de-emphasis for 32, 44.1, 48 and 96 kHz f_s via L3 and, for 32, 44.1 and 48 kHz in static mode
- Soft or quick mute via L3
- Output signal polarity control via L3 microcontroller interface.

1.4 Advanced audio conPfiguration

- 6-channel line output (under L3 volume control)
- A stereo differential output (channel 1 and channel 2) for improved performance
- High linearity, wide dynamic range, low distortion.

4 ORDERING INFORMATION

TYPE NUMBER	PACKAGE		
	NAME	DESCRIPTION	VERSION
UDA1328T	SO32	plastic small outline package; 32 leads; body width 7.5 mm	SOT287-1

2 APPLICATIONS

This multi-channel DAC is eminently suitable for DVD-like applications in which 5.1 channel encoded signals are used.

3 GENERAL DESCRIPTION

The UDA1328 is a single-chip 6-channel DAC employing bitstream conversion techniques, which can be used either in L3 microcontroller mode or in static pin mode.

The UDA1328 supports the I²S-bus data format with word lengths of up to 24 bits, the MSB-justified data format with word lengths of up to 24 bits and the LSB-justified serial data format with word lengths of 16, 18, 20 and 24 bits.

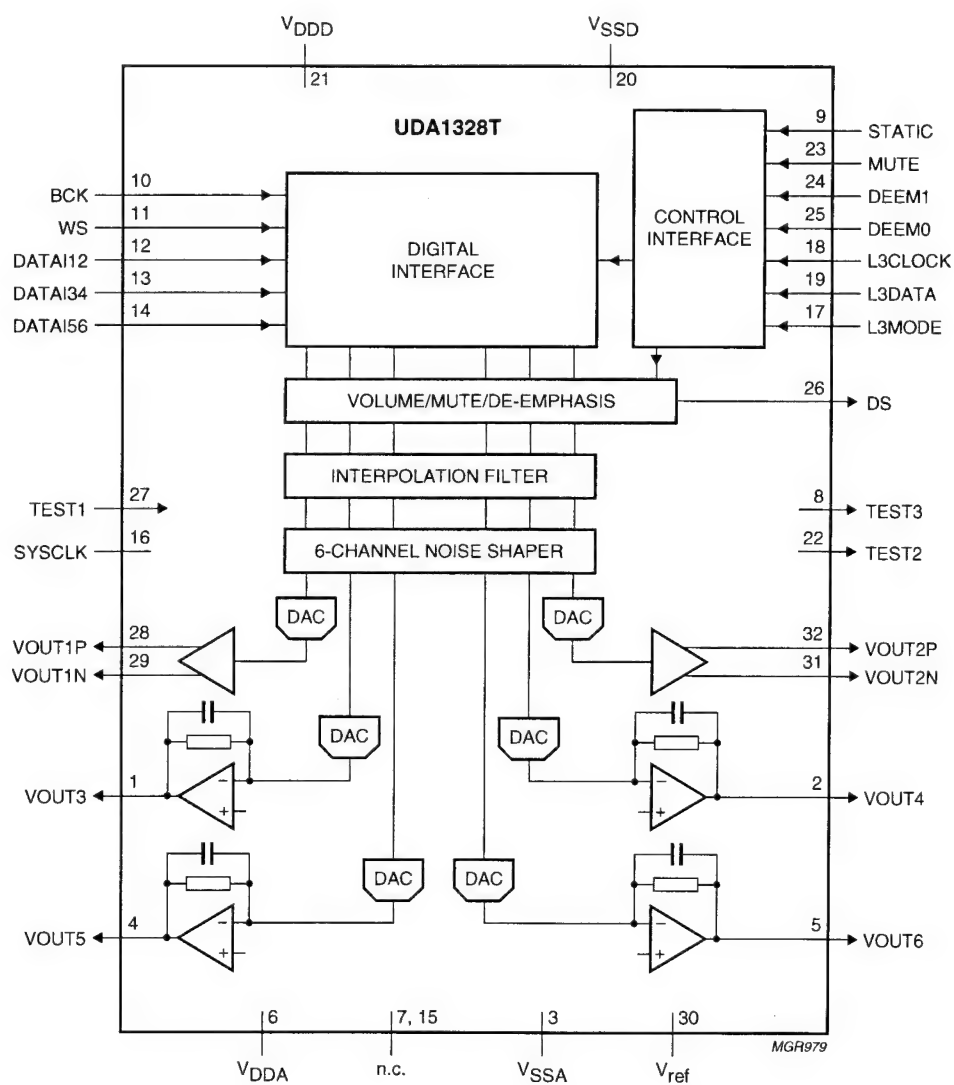

All digital sound processing features can be controlled with the L3 interface e.g. volume control, selecting digital silence type, output polarity control and mute. Also system features such as power control, digital silence detection mode and output polarity control.

Under static pin control, via static pins, the system clock can be set to either 256f_s or 384f_s support, digital de-emphasis can be set, there is digital mute and the digital input formats can also be set.

Multi-channel P1ter DAC

UDA1328T

8 FUNCTIONAL DESCRIPTION

8.1 System clock

The UDA1328 operates in slave mode only, this means that in all applications the system must provide the system clock. The system frequency is selectable. The options are 256f_s, 384f_s, 512f_s and 768f_s for the L3 mode and 256f_s or 384f_s for the static mode. The system clock must be frequency-locked to the digital interface signals.

It should be noted that the UDA1328 can operate from 5 to 100 kHz sampling frequency (f_s). However in 768f_s mode the sampling frequency must be limited to 55 kHz.

8.2 Application modes

Operating mode can be set with the STATIC pin, either to L3 mode (STATIC = LOW) or to the static mode (STATIC = HIGH). See Table 1 for pin functions in the static mode.

Table 1 Mode selection in the static mode

PIN	L3 MODE	STATIC MODE
L3CLOCK	L3CLOCK	clock select
L3MODE	L3MODE	SF1 ⁽¹⁾
L3DATA	L3DATA	SF0 ⁽¹⁾
MUTE	X ⁽²⁾	MUTE
DEEM1	X ⁽²⁾	DEEM1
DEEM0	L3ADR	DEEM0

Notes

- SF1 and SF0 are the Serial Format inputs (2-bit).
- X means that the pin has no function in this mode and can best be connected to ground.

8.3 Interpolation P1ter (DAC)

The digital filter interpolates from 1 to 128f_s by cascading a half-band filter and a FIR filter, see Table 2. The overall filter characteristic of the digital filters is illustrated in Fig.3, and the pass-band ripple is illustrated in Fig.4. Both figures are with a 44.1 kHz sampling frequency.

Table 2 Interpolation P1ter characteristics

ITEM	CONDITION	VALUE (dB)
Pass-band ripple	0 to 0.45f _s	±0.02
Stop band	>0.55f _s	-55
Dynamic range	0 to 0.45f _s	>114
DC gain	-	-3.5

8.4 Digital silence detection

The UDA1328 can detect digital silence conditions in channels 1 to 6, and report this via the output pin DS. This function is implemented to allow for external manipulation of the audio signal in the absence of program material, such as muting or recorder control.

An active LOW output is produced at the DS pin if the channels selected via L3 or for all channels in static mode, carries all zeroes for at least 9600 consecutive audio samples (equals 200 ms for f_s = 48 kHz). The DS pin is also active LOW when the output is digitally muted either via the L3 interface or via the STATIC pin.

In static mode all channels participate in the digital silence detection. In L3 mode control each channel can be set, either to participate in the digital silence detection or not.

8.5 Noise shaper

The 3rd-order noise shaper operates at 128f_s. It shifts in-band quantization noise to frequencies well above the audio band. This noise shaping technique enables high signal-to-noise ratios to be achieved. The noise shaper output is converted into an analog signal using a Filter Stream DAC (FSDAC).

8.6 Filter stream DAC

The FSDAC is a semi-digital reconstruction filter that converts the 1-bit data stream of the noise shaper to an analog output voltage. The filter coefficients are implemented as current sources and are summed at virtual ground of the output operational amplifier. In this way very high signal-to-noise performance and low clock jitter sensitivity is achieved. No post-filter is needed due to the inherent filter function of the DAC. On-board amplifiers convert the FSDAC output current to an output voltage signal capable of driving a line output.

The output voltage of the FSDAC scales proportionally with the power supply voltage.

8.7 Static mode

The UDA1328 is set to static mode by setting the STATIC pin HIGH. The function of 6 pins of the device now get another function as can be seen in Table 1.

8.7.1 SYSTEM CLOCK SETTING

In static mode pin 18 (L3CLOCK) is used to select the system clock setting. When pin 18 is LOW, the device is in 256f_s mode, when pin 18 is HIGH the device is in 384f_s mode.

Multi-channel filter DAC

UDA1328T

8.7.2 DE-EMPHASIS CONTROL

In static pin mode the pins DEEM0 and DEEM1 control the de-emphasis mode; see Table 3.

Table 3 De-emphasis control

DEEM MODE	DEEM1	DEEM0
No de-emphasis	0	0
32 kHz de-emphasis	0	1
44.1 kHz de-emphasis	1	0
48 kHz de-emphasis	1	1

8.7.3 DIGITAL INTERFACE FORMATS

In static pin mode the digital audio interface formats can be selected via pin 17 (SF1) and 19 (SF0). The following interface formats can be selected (see also Table 4):

- I²S-bus with data word length of up to 24 bits
- LSB-justified format with data word length of 16, 20 or 24 bits.

Table 4 Input format selection in the static mode

INPUT FORMAT	SF1	SF0
I ² S-bus	0	0
LSB-justified 16bits	0	1
LSB-justified 20bits	1	0
LSB-justified 24bits	1	1

It should be noted that the digital audio interface holds that the BCK frequency can be 64 times the WS maximum frequency, or $f_{BCK} \leq 64 \times f_{WS}$

8.8 L3 mode

The device is set to L3 mode by setting the STATIC pin to LOW. The device can then be controlled via the L3 microcontroller interface (see Chapter 9).

8.8.1 DIGITAL INTERFACE FORMATS

The following interface formats can be selected in the L3 mode:

- I²S-bus with data word length of up to 24 bits
- MSB-justified with data word length of up to 24 bits
- LSB-justified format with data word length of 16, 18, 20 or 24 bits.

8.8.2 L3 ADDRESS

The UDA1328 can be addressed via the L3 microcontroller interface using one of two addresses. This is done in order to individually control the UDA1328 and other Philips DACs or CODECs via the same L3 bus.

The address can be selected using pin 25 (DEEM0) in L3 mode. When pin 25 is set LOW, the address is 000100. When pin 25 is set HIGH the address is 000101.

9.7.2 IC7004: UDA1360TS

Low-voltage low-power stereo audio ADC

UDA1360TS

FEATURES

General

- Low power consumption
- 2.4 to 3.6 V power supply
- Supports 256 and 384f_s system clock
- Supports sampling frequency range of 5 to 55 kHz
- Small package size (SSOP16)
- Integrated high-pass filter to cancel DC offset
- Power-down mode
- Supports 2 V (RMS) input signals
- Easy application
- Non-inverting ADC plus decimation filter.

Multiple format output interface

- I²S-bus and MSB-justified format compatible
- Up to 20 significant bits serial output.

Advanced audio configuration

- Stereo single-ended input configuration
- High linearity, dynamic range and low distortion.

BITSTREAM CONVERSION

GENERAL DESCRIPTION

The UDA1360TS is a single chip stereo Analog-to-Digital Converter (ADC) employing bitstream conversion techniques. The low power consumption and low voltage requirements make the device eminently suitable for use in low-voltage low-power portable digital audio equipment which incorporates recording functions.

The UDA1360TS supports the I²S-bus data format and the MSB-justified data format with word lengths of up to 20 bits.

QUICK REFERENCE DATA

FUNCTIONAL DESCRIPTION

System clock

The UDA1360TS accommodates slave mode only, this means that in all applications the system devices must provide the system clock. The system frequency is selectable via the static FSEL pin, and the system clock must be locked in frequency to the digital interface input signals.

The options are 256f_s (FSEL = LOW) and 384f_s (FSEL = HIGH). The sampling frequency range is 5 to 55 kHz.

The BCK clock can be up to 128f_s, or in other words the BCK frequency is 128 times the Word Select (WS) frequency or less: $f_{BCK} \leq 128 \times f_{WS}$.

Notes:

1. The WS edge MUST fall on the negative edge of the BCK at all times for proper operation of the digital I/O data interface.
2. For MSB justified formats it is important to have a WS signal with 50% duty factor.

Analog-to-Digital Converter (ADC)

The stereo ADC of the UDA1360TS consists of two 3rd-order Sigma-Delta modulators. They have a modified Ritchie-coder architecture in a differential switched capacitor implementation. The over-sampling ratio is 128.

Input level

The overall system gain is proportional to V_{DDA} . The 0 dB input level is defined as that which gives a -1 dBFS digital output (relative to the full-scale swing). In addition, an input gain switch is incorporated with the above definitions.

The UDA1360TS front-end is equipped with a selectable 0 or 6 dB gain, in order to support 2 V (RMS) input using a series resistor of 12 k Ω .

For the definition of the pin settings for 1 or 2 V (RMS) mode given in Table 1, it is assumed that this resistor is present as a default component.

If the 2 V (RMS) signal input is not needed, the external resistor should not be used.

Low-voltage low-power stereo audio ADC

UDA1360TS

Table 1 Application modes using input gain stage

RESISTOR (12 kΩ)	INPUT GAIN SWITCH	MAXIMUM INPUT VOLTAGE
Present	0 dB	2 V (RMS)
Present	6 dB	1 V (RMS)
Absent	0 dB	1 V (RMS)
Absent	6 dB	0.5 V (RMS)

Multiple format output interface

The UDA1360TS supports the following data output formats:

- I²S-bus with data word length of up to 20 bits
- MSB-justified serial format with data word length of up to 20 bits.

The output format can be set by the static SFOR pin. When SFOR is LOW, the I²S-bus is selected, when SFOR is set HIGH the MSB-justified format is selected.

The data formats are illustrated in Fig.4. Left and right data channel words are time multiplexed.

Decimation filter

The decimation from 128f_s is performed in two stages. The first stage realizes 3rd-order sin x/x characteristic. This filter decreases the sample rate by 16. The second stage (an FIR filter) consists of 3 half-band filters, each decimating by a factor of 2.

Table 2 DC cancellation filter characteristics

ITEM	CONDITION	VALUE (dB)
Pass-band ripple		none
Pass-band gain		0
Stop band	>0.55f _s	-60
Droop	at 0.00045f _s	0.031
Attenuation at DC	at 0.00000036f _s	>40
Dynamic range	0 to 0.45f _s	>110

Mute

On recovery from power-down, the serial data output DATAO is held LOW until valid data is available from the decimation filter. This time tracks with the sampling frequency:

$$t = \frac{12288}{f_s} = 279 \text{ ms ; where } f_s = 44.1 \text{ kHz.}$$

Power-down mode

The PWON pin can control the power saving together with the optional gain switch for 2 V (RMS) or 1 V (RMS) input. When the PWON pin is set LOW, the ADC is set to power-down. When PWON is set to HIGH or to half the power supply, then either 6 dB gain or 0 dB gain in the analog front-end is selected.

Application modes

The UDA1360TS can be set to different modes using two 3-level pins and one 2-level pin. The selection of modes is given in Table 3.

Table 3 Mode selection summary

PIN	V _{SS}	½V _{DD}	V _{DD}
SFOR	I ² S-bus	test mode	MSB
PWON	power-down	0 dB gain	6 dB gain
FSEL	256f _s	–	384f _s

9.7.3 IC7430: BA7660FS

3-channel 75Ω driver

BA7660FS

The BA7660FS is a 75Ω driver with a 6dB amplifier and three internal circuits, and provides 75Ω drive of composite Y signals and C signals, as well as RGB signals. Each load is capable of driving two circuits, and a sag correction function reduces the capacitance of the output coupling capacitor.

The input voltage is within a range of 0V to 1.5V, enabling direct connection of ordinary D / A converter output. An internal power-saving circuit is also included which provides simultaneous muting on all three channels, and output pin shorting protection.

●Applications

DVDs, set top boxes and other digital video devices

●Features

- 1) Can be coupled directly to D / A converter output.
- 2) Operates at a low power consumption (115mW typ.).
- 3) Internal output muting circuit.
- 4) Internal power-saving circuit.
- 5) Internal output protection circuit.
- 6) An internal sag correction function makes it possible to reduce the capacitance of the output coupling capacitor.
- 7) Each load is capable of driving two circuits.
- 8) The compact 16-pin SSOP-A package is used.

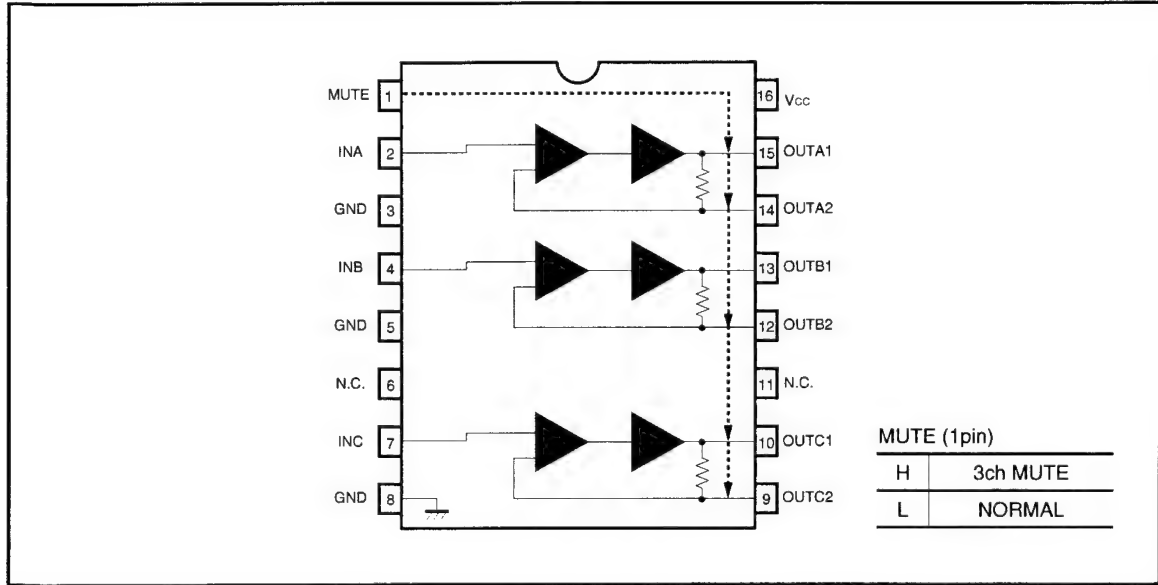

●Absolute maximum ratings (Ta = 25°C)

Parameter	Symbol	Limits	Unit
Power supply voltage	Vcc	8	V
Power dissipation	Pd	650	mW

STV6410

AUDIO/VIDEO SWITCH MATRIX

- I²C BUS CONTROL
- STANDBY MODE

VIDEO SECTION

- 5 CVBS INPUTS, 4 CVBS OUTPUTS (ONE WITH SELECTABLE CHROMA TRAP FILTER)
- 5 Y/C INPUTS, 3 Y/C OUTPUTS
- 6dB GAIN ON ALL CVBS/Y AND C OUTPUTS
- 1 Y/C ADDER
- 2 RGB/FB INPUTS, 1 RGB/FB OUTPUT WITH 6dB ADJUSTABLE GAIN
- VIDEO MUTING ON ALL THE OUTPUTS
- 3 SLOW BLANKING INPUTS/OUTPUTS
- SYNC BOTTOM CLAMP ON ALL CVBS/Y AND RGB INPUTS, AVERAGE ON C INPUTS
- BANDWIDTH : 15MHz
- CROSSTALK : 60dB Typ.

AUDIO SECTION

- 5 STEREO INPUTS, 4 STEREO OUTPUTS (TWO WITH LEVEL ADJUSTMENT)
- MONO SOUND OUTPUT
- MONO SOUND CAPABILITY ON TV OUTPUTS
- AUDIO MUTING ON ALL THE OUTPUTS

DESCRIPTION

The STV6410 is a highly integrated I²C bus-controlled audio and video switch matrix, optimized for use in digital set-top box applications. It provides all the audio and video routings required in a full three scart set-top box design. It is also fully pin compatible with STV6411, the two scart version.

BLOCK DIAGRAM

9.7.5 IC7600: MSP3415D

Multistandard Sound Processor Family

Release Note: Revision bars indicate significant changes to the previous edition. The hardware and software description in this document is valid for the MSP 34x5G version B8 and following versions.

1. Introduction

The MSP 34x5G family of single-chip Multistandard Sound Processors covers the sound processing of all analog TV standards worldwide, as well as the NICAM digital sound standards. The full TV sound processing, starting with analog sound IF signal-in, down to processed analog AF-out, is performed in a single chip. Figure 1-1 shows a simplified functional block diagram of the MSP 34x5G.

These TV sound processing ICs include versions for processing the multichannel television sound (MTS) signal conforming to the standard recommended by the Broadcast Television Systems Committee (BTSC). The DBX noise reduction, or alternatively, Micronas Noise Reduction (MNR) is performed alignment free.

Other processed standards are the Japanese FM-FM multiplex standard (EIA-J) and the FM-Stereo-Radio standard.

Current ICs have to perform adjustment procedures in order to achieve good stereo separation for BTSC and

EIA-J. The MSP 34x5G has optimum stereo performance without any adjustments.

All MSP 34xxG versions are pin compatible to the MSP 34xxD. Only minor modifications are necessary to adapt a MSP 34xxD controlling software to the MSP 34xxG. The MSP 34x5G further simplifies controlling software. Standard selection requires a single I²C transmission only.

Note: The MSP 34x5G version has reduced control registers and less functional pins. The remaining registers are software-compatible to the MSP 34x0G. The pinning is compatible to the MSP 34x0G.

The MSP 34x5G has built-in automatic functions: The IC is able to detect the actual sound standard automatically (Automatic Standard Detection). Furthermore, pilot levels and identification signals can be evaluated internally with subsequent switching between mono/stereo/bilingual; no I²C interaction is necessary (Automatic Sound Selection).

The MSP 34x5G can handle very high FM deviations even in conjunction with NICAM processing. This is especially important for the introduction of NICAM in China.

The ICs are produced in submicron CMOS technology. The MSP 34x5G is available in the following packages: PSDIP64, PSDIP52, PMQFP44, PLQFP64, and PQFP80.

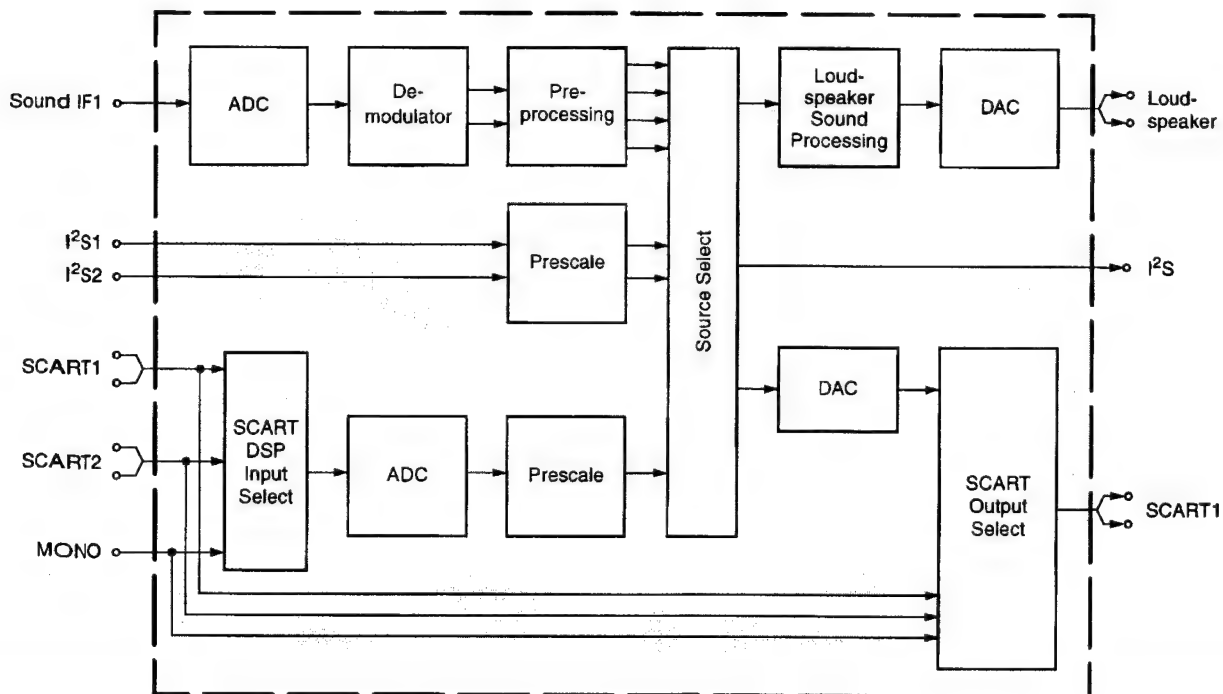

Fig. 1-1: Simplified functional block diagram of MSP 34x5G

2. Functional Description

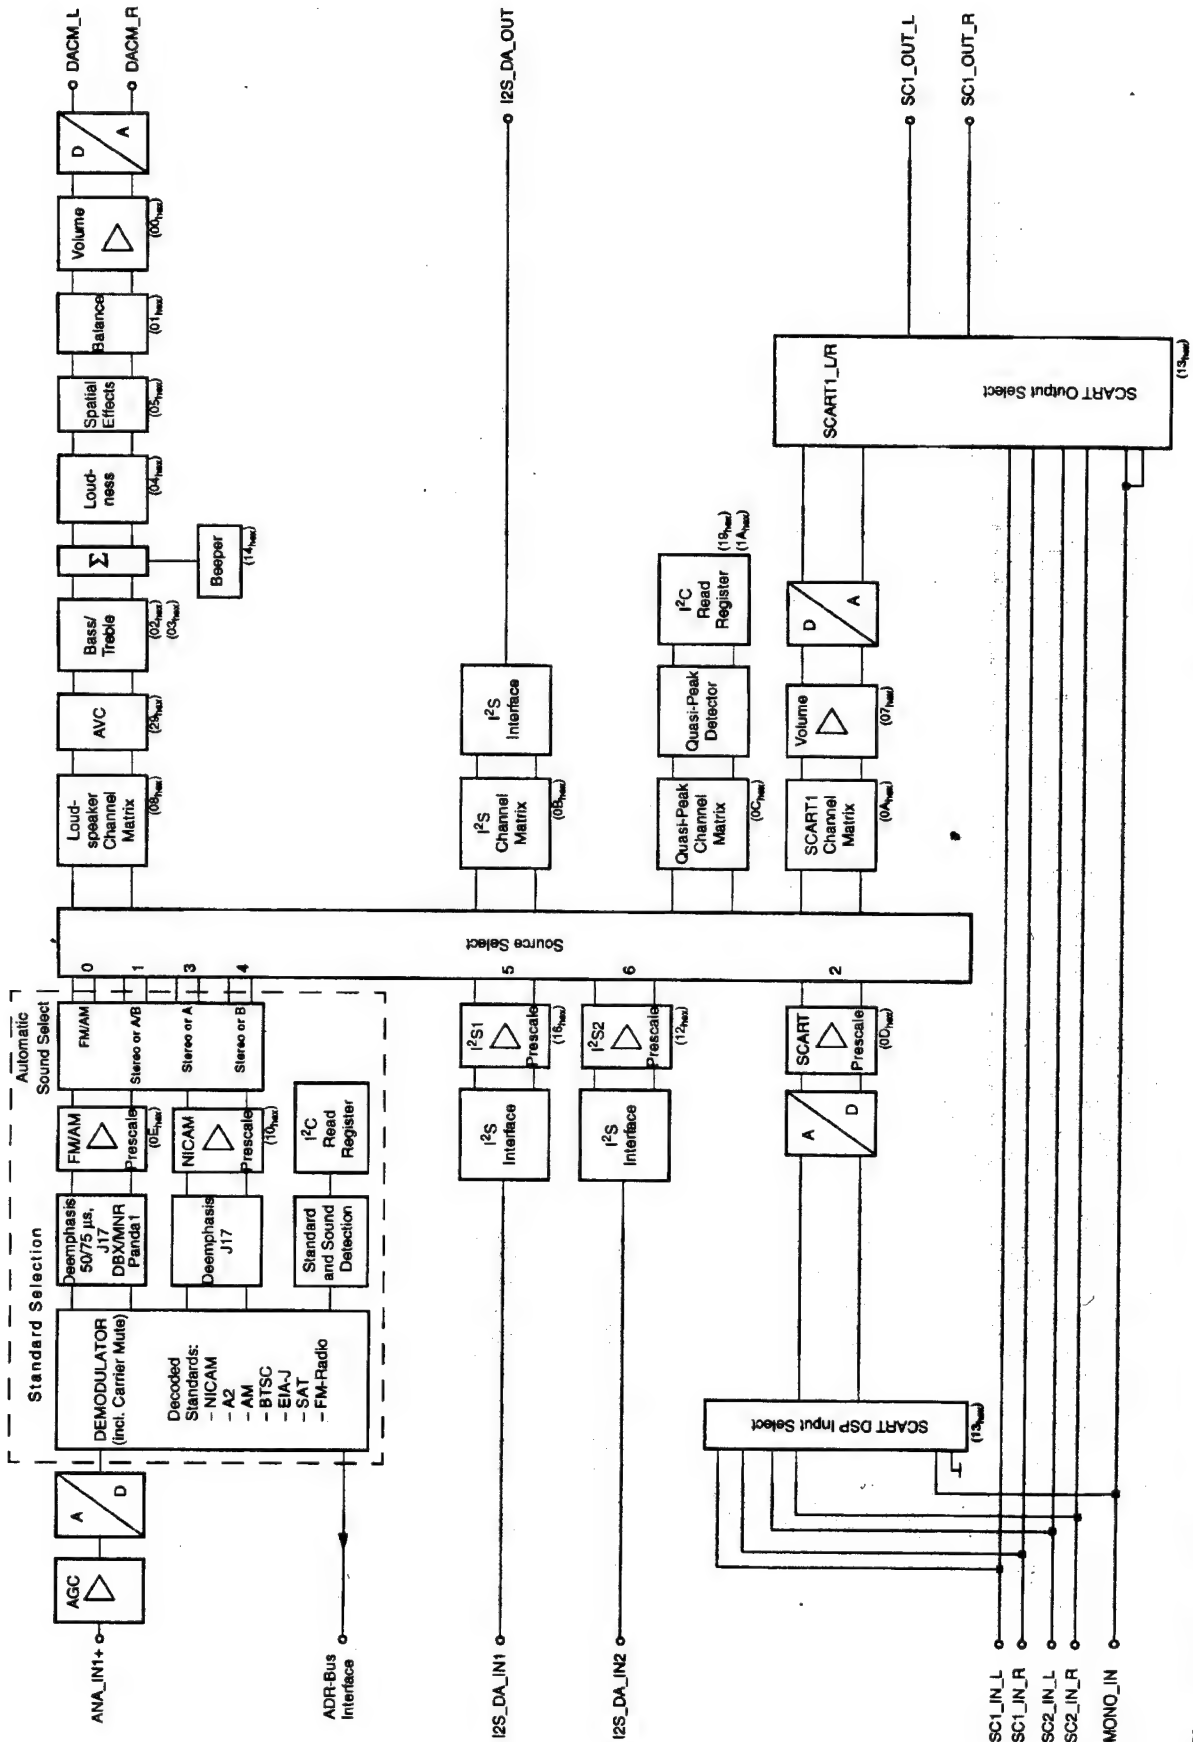

Fig. 2-1: Signal flow block diagram of the MSP 34x5G (input and output names correspond to pin names).

2.1. Architecture of the MSP 34x5G Family

Fig. 2-1 on page 8 shows a simplified block diagram of the IC. The block diagram contains all features of the MSP 3455G. Other members of the MSP 34x5G family do not have the complete set of features: The demodulator handles only a subset of the standards presented in the demodulator block; NICAM processing is only possible in the MSP 3415G and MSP 3455G (see dashed block in Fig. 2-1).

2.2. Sound IF Processing

2.2.1. Analog Sound IF Input

The input pins ANA_IN1+ and ANA_IN- offer the possibility to connect sound IF (SIF) sources to the MSP 34x5G. The analog-to-digital conversion of the preselected sound IF signal is done by an A/D-converter. An analog automatic gain circuit (AGC) allows a wide range of input levels. The high-pass filter formed by the coupling capacitor at pin ANA_IN1+ (see Section 7. "Appendix D: Application Information" on page 92) is sufficient in most cases to suppress video components. Some combinations of SAW filters and sound IF mixer ICs, however, show large picture components on their outputs. In this case, further filtering is recommended.

2.2.2. Demodulator: Standards and Features

The MSP 34x5G is able to demodulate all TV sound standards worldwide including the digital NICAM system. Depending on the MSP 34x5G version, the following demodulation modes can be performed:

A2-Systems: Detection and demodulation of two separate FM carriers (FM1 and FM2), demodulation and evaluation of the identification signal of carrier FM2.

NICAM-Systems: Demodulation and decoding of the NICAM carrier, detection and demodulation of the analog (FM or AM) carrier. For D/K-NICAM, the FM carrier may have a maximum deviation of 384 kHz.

Very high deviation FM-Mono: Detection and robust demodulation of one FM carrier with a maximum deviation of 540 kHz.

BTSC-Stereo: Detection and FM demodulation of the aural carrier resulting in the MTS/MPX signal. Detection and evaluation of the pilot carrier, AM demodulation of the (L-R)-carrier and detection of the SAP subcarrier. Processing of the DBX noise reduction or Micronas Noise Reduction (MNR).

BTSC-Mono + SAP: Detection and FM demodulation of the aural carrier resulting in the MTS/MPX signal. Detection and evaluation of the pilot carrier, detection and FM demodulation of the SAP-subcarrier. Processing of the DBX noise reduction or Micronas Noise Reduction (MNR).

Japan Stereo: Detection and FM demodulation of the aural carrier resulting in the MPX signal. Demodulation and evaluation of the identification signal and FM demodulation of the (L-R)-carrier.

FM-Satellite Sound: Demodulation of one or two FM carriers. Processing of high-deviation mono or narrow bandwidth mono, stereo, or bilingual satellite sound according to the ASTRA specification.

FM-Stereo-Radio: Detection and FM demodulation of the aural carrier resulting in the MPX signal. Detection and evaluation of the pilot carrier and AM demodulation of the (L-R)-carrier.

The demodulator blocks of all MSP 34x5G versions have identical user interfaces. Even completely different systems like the BTSC and NICAM systems are controlled the same way. Standards are selected by means of MSP Standard Codes. Automatic processes handle standard detection and identification without controller interaction. The key features of the MSP 34x5G demodulator blocks are

Standard Selection: The controlling of the demodulator is minimized: All parameters, such as tuning frequencies or filter bandwidth, are adjusted automatically by transmitting one single value to the STANDARD SELECT register. For all standards, specific MSP standard codes are defined.

Automatic Standard Detection: If the TV sound standard is unknown, the MSP 34x5G can automatically detect the actual standard, switch to that standard, and respond the actual MSP standard code.

Automatic Carrier Mute: To prevent noise effects or FM identification problems in the absence of an FM carrier, the MSP 34x5G offers a configurable carrier mute feature, which is activated automatically if the TV sound standard is selected by means of the STANDARD SELECT register. If no FM carrier is detected at one of the two MSP demodulator channels, the corresponding demodulator output is muted. This is indicated in the STATUS register.

2.2.3. Preprocessing of Demodulator Signals

The NICAM signals must be processed by a deemphasis filter and adjusted in level. The analog demodulated signals must be processed by a deemphasis filter, adjusted in level, and dematrixed. The correct deemphasis filters are already selected by setting the standard in the STANDARD SELECT register. The level adjustment has to be done by means of the FM/AM and NICAM prescale registers. The necessary dematrix function depends on the selected sound standard and the actual broadcasted sound mode (mono, stereo, or bilingual). It can be manually set by the FM Matrix Mode register or automatically by the Automatic Sound Selection.

2.2.4. Automatic Sound Select

In the Automatic Sound Select mode, the dematrix function is automatically selected based on the identification information in the STATUS register. No I²C interaction is necessary when the broadcasted sound mode changes (e.g. from mono to stereo).

The demodulator supports the identification check by switching between mono-compatible standards (standards that have the same FM-Mono carrier) automatically and non-audible. If B/G-FM or B/G-NICAM is selected, the MSP will switch between these standards. The same action is performed for the standards: D/K1-FM, D/K2-FM, and D/K-NICAM. Switching is only done in the absence of any stereo or bilingual identification. If identification is found, the MSP keeps the detected standard.

In case of high bit-error rates, the MSP 34x5G automatically falls back from digital NICAM sound to analog FM or AM mono.

Table 2-1 summarizes all actions that take place when Automatic Sound Select is switched on.

To provide more flexibility, the Automatic Sound Select block prepares four different source channels of demodulated sound (Fig. 2-2). By choosing one of the four demodulator channels, the preferred sound mode can be selected for each of the output channels (loud-speaker, headphone, etc.). This is done by means of the Source Select registers.

The following source channels of demodulated sound are defined:

- **“FM/AM” channel:** Analog mono sound, stereo if available. In case of NICAM, analog mono only (FM or AM mono).
- **“Stereo or A/B” channel:** Analog or digital mono sound, stereo if available. In case of bilingual broadcast, it contains both languages A (left) and B (right).

- **“Stereo or A” channel:** Analog or digital mono sound, stereo if available. In case of bilingual broadcast, it contains language A (on left and right).
- **“Stereo or B” channel:** Analog or digital mono sound, stereo if available. In case of bilingual broadcast, it contains language B (on left and right).

Fig. 2-2 and Table 2-2 show the source channel assignment of the demodulated signals in case of Automatic Sound Select mode for all sound standards.

Note: The analog primary input channel contains the signal of the mono FM/AM carrier or the L+R signal of the MPX carrier. The secondary input channel contains the signal of the 2nd FM carrier, the L-R signal of the MPX carrier, or the SAP signal.

Fig. 2-2: Source channel assignment of demodulated signals in Automatic Sound Select Mode

2.2.5. Manual Mode

Fig. 2-3 shows the source channel assignment of demodulated signals in case of manual mode. If manual mode is required, more information can be found in Section 6.7. “Demodulator Source Channels in Manual Mode” on page 90.

Fig. 2-3: Source channel assignment of demodulated signals in Manual Mode

2.3. Preprocessing for SCART and I²S Input Signals

The SCART and I²S inputs need only be adjusted in level by means of the SCART and I²S prescale registers.

2.4. Source Selection and Output Channel Matrix

The Source Selector makes it possible to distribute all source signals (one of the demodulator source channels or SCART) to the desired output channels (loudspeaker, etc.). All input and output signals can be processed simultaneously. Each source channel is identified by a unique source address.

For each output channel, the sound mode can be set to sound A, sound B, stereo, or mono by means of the output channel matrix.

If Automatic Sound Select is on, the output channel matrix can stay fixed to stereo (transparent) for demodulated signals.

2.5. Audio Baseband Processing

2.5.1. Automatic Volume Correction (AVC)

Different sound sources (e.g. terrestrial channels, SAT channels, or SCART) fairly often do not have the same volume level. Advertisements during movies usually have a higher volume level than the movie itself. This results in annoying volume changes. The AVC solves this problem by equalizing the volume level.

To prevent clipping, the AVC's gain decreases quickly in dynamic boost conditions. To suppress oscillation effects, the gain increases rather slowly for low level inputs. The decay time is programmable by means of the AVC register (see page 30).

For input signals ranging from -24 dBr to 0 dBr, the AVC maintains a fixed output level of -18 dBr. Fig. 2-4 shows the AVC output level versus its input level. For prescale and volume registers set to 0 dB, a level of 0 dBr corresponds to full scale input/output. This is

- SCART input/output 0 dBr = 2.0 V_{rms}
- Loudspeaker output 0 dBr = 1.4 V_{rms}

Fig. 2-4: Simplified AVC characteristics

2.5.2. Loudspeaker Outputs

The following baseband features are implemented in the loudspeaker output channels: bass/treble, loudness, balance, and volume. A square wave beeper can be added to the loudspeaker channel.

2.5.3. Quasi-Peak Detector

The quasi-peak readout register can be used to read out the quasi-peak level of any input source. The feature is based on following filter time constants:

attack time: 1.3 ms
decay time: 37 ms

2.6. SCART Signal Routing

2.6.1. SCART DSP In and SCART Out Select

The SCART DSP Input Select and SCART Output Select blocks include full matrix switching facilities. To design a TV set with two pairs of SCART-inputs and one pair of SCART-outputs, no external switching hardware is required. The switches are controlled by the ACB user register (see page 34).

2.6.2. Stand-by Mode

If the MSP 34x5G is switched off by first pulling STANDBYQ low and then (after $>1\ \mu\text{s}$ delay) switching off DVSUP and AVSUP, but keeping AHVSUP ('Stand-by'-mode), the SCART switches maintain their position and function. This allows the copying from selected SCART-inputs to SCART-outputs in the TV set's stand-by mode.

In case of power on or starting from stand-by (switching on the DVSUP and AVSUP, RESETQ going high 2 ms later), all internal registers except the ACB register (page 34) are reset to the default configuration (see Table 3–5 on page 18). The reset position of the ACB register becomes active after the first I²C transmission into the Baseband Processing part. By transmitting the ACB register first, the reset state can be redefined.

2.7. I²S Bus Interface

The MSP 34x5G has a synchronous master/slave input/output interface running on 32 kHz.

The interface accepts two formats:

1. I²S_WS changes at the word boundary
2. I²S_WS changes one I²S-clock period before the word boundaries.

All I²S options are set by means of the MODUS and the I2S_CONFIG registers.

The I²S bus interface consists of five pins:

- I2S_DA_IN1, I2S_DA_IN2:
I²S serial data input: 16, 18....32 bits per sample
- I2S_DA_OUT:
I²S serial data output: 16, 18...32 bits per sample
- I2S_CL:
I²S serial clock
- I2S_WS:
I²S word strobe signal defines the left and right sample

If the MSP 34x5G serves as the master on the I²S interface, the clock and word strobe lines are driven by the IC. In this mode, only 16 or 32 bits per sample can be selected. In slave mode, these lines are input to the IC and the MSP clock is synchronized to 576 times the I2S_WS rate (32 kHz). NICAM operation is not possible in slave mode.

An I²S timing diagram is shown in Fig. 4–28 on page 62.

2.8. ADR Bus Interface

For the ASTRA Digital Radio System (ADR), the MSP 3405G, MSP 3415G, and MSP 3455G performs preprocessing such as carrier selection and filtering. Via the 3-line ADR-bus, the resulting signals are transferred to the DRP 3510A coprocessor, where the source decoding is performed. To be prepared for an upgrade to ADR with an additional DRP board, the following lines of MSP 34x5G should be provided on a feature connector:

- I2S_DA_IN1 or I2S_DA_IN2
- I2S_DA_OUT
- I2S_WS
- I2S_CL
- ADR_CL, ADR_WS, ADR_DA

For more details, please refer to the DRP 3510A data sheet.

2.9. Digital Control I/O Pins and Status Change Indication

The static level of the digital input/output pins D_CTR_I/O_0/1 is switchable between HIGH and LOW via the I²C-bus by means of the ACB register (see page 34). This enables the controlling of external hardware switches or other devices via I²C-bus.

The digital input/output pins can be set to high impedance by means of the MODUS register (see page 23). In this mode, the pins can be used as input. The current state can be read out of the STATUS register (see page 25).

Optionally, the pin D_CTR_I/O_1 can be used as an interrupt request signal to the controller, indicating any changes in the read register STATUS. This makes polling unnecessary; I²C-bus interactions are reduced to a minimum (see STATUS register on page 25 and MODUS register on page 23).

2.10. Clock PLL Oscillator and Crystal Specifications

The MSP 34x5G derives all internal system clocks from the 18.432 MHz oscillator. In NICAM or in I²S-Slave mode, the clock is phase-locked to the corresponding source. Therefore, it is not possible to use NICAM and I²S-Slave mode at the same time.

For proper performance, the MSP clock oscillator requires a 18.432-MHz crystal. Note, that for the phase-locked mode (NICAM, I²S slave), crystals with tighter tolerance are required.

4.2. Pin Connections and Short Descriptions

NC = not connected; leave vacant

LV = if not used, leave vacant

DVSS: if not used, connect to DVSS

X = obligatory; connect as described in circuit diagram

AHVSS: connect to AHVSS

Single/multistandard VIF/SIF-PLL and
FM-PLL/AM demodulators

TDA9817; TDA9818

FEATURES

- 5 V supply voltage
- Applicable for IFs (Intermediate Frequencies) of 38.9 MHz, 45.75 MHz and 58.75 MHz
- Gain controlled wide band Video IF (VIF)-amplifier (AC-coupled)
- True synchronous demodulation with active carrier regeneration (very linear demodulation, good intermodulation figures, reduced harmonics, excellent pulse response)
- Robustness for over-modulation better than 105% due to gated phase detector at L/L accent standard and PLL-bandwidth control at negative modulated standards
- VCO (Voltage Controlled Oscillator) frequency switchable between L and L accent (alignment external) picture carrier frequency
- VIF AGC (Automatic Gain Control) detector for gain control, operating as peak sync detector for B/G, peak white detector for L; signal controlled reaction time for L
- Tuner AGC with adjustable TakeOver Point (TOP)
- AFC (Automatic Frequency Control) detector without extra reference circuit

- AC-coupled limiter amplifier for sound intercarrier signal
- Alignment-free FM PLL (Phase Locked Loop) demodulator with high linearity
- SIF (Sound IF) input for single reference QSS (Quasi Split Sound) mode (PLL controlled); SIF AGC detector for gain controlled SIF amplifier; single reference QSS mixer able to operate in high performance single reference QSS mode and in intercarrier mode
- AM demodulator without extra reference circuit
- Stabilizer circuit for ripple rejection and to achieve constant output signals
- ESD (Electrostatic Discharge) protection for all pins.

GENERAL DESCRIPTION

The TDA9817 is an integrated circuit for single standard vision IF signal processing and FM demodulation.

The TDA9818 is an integrated circuit for multistandard vision IF signal processing, sound AM and FM demodulation.

Note

1. Not connected for TDA9817.

Single/multistandard VIF/SIF-PLL and FM-PLL/AM demodulators

TDA9817; TDA9818

FUNCTIONAL DESCRIPTION

The integrated circuit comprises the functional blocks as shown in Fig.1:

- Vision IF amplifier and VIF AGC detector
- Tuner AGC
- Frequency Phase Locked Loop detector (FPLL)
- VCO, Travelling Wave Divider (TWD) and AFC
- Video demodulator and amplifier
- SIF amplifier and SIF AGC
- Single reference QSS mixer
- AM demodulator
- FM-PLL demodulator
- AF (Audio Frequency) signal processing
- Internal voltage stabilizer.

Vision IF amplifier and VIF AGC detector

The vision IF amplifier consists of three AC-coupled differential amplifier stages. Each differential stage comprises a feedback network controlled by emitter degeneration.

The AGC detector generates the required VIF gain control voltage for constant video output by charging/discharging the AGC capacitor. Therefore for negative video modulation the sync level and for positive video modulation the peak white level of the video signal is detected. In order to reduce the reaction time for positive modulation, where a very large time constant is needed, an additional level detector increases the discharging current of the AGC capacitor (fast mode) in the event of a decreasing VIF amplitude step. The additional level information is given by the black-level detector voltage.

Tuner AGC

The AGC capacitor voltage is converted to an internal IF control signal, and is fed to the tuner AGC to generate the tuner AGC output current at pin TAGC (open-collector output). The tuner AGC takeover point can be adjusted at pin TADJ. This allows to match the tuner to the SAW filter in order to achieve the optimum IF input level.

Frequency Phase Locked Loop detector (FPLL)

The VIF-amplifier output signal is fed into a frequency detector and into a phase detector via a limiting amplifier. During acquisition the frequency detector produces a DC current proportional to the frequency difference between the input and the VCO signal. After frequency lock-in the phase detector produces a DC current proportional to the

phase difference between the VCO and the input signal. The DC current of either frequency detector or phase detector is converted into a DC voltage via the loop filter, which controls the VCO frequency. In the event of positive modulated signals the phase detector is gated by composite sync in order to avoid signal distortion for overmodulated VIF signals.

VCO, Travelling Wave Divider (TWD) and AFC

The VCO operates with a resonance circuit (with L and C in parallel) at double the PC frequency. The VCO is controlled by two integrated variable capacitors. The control voltage required to tune the VCO from its free-running frequency to actually double the PC frequency is generated by the frequency-phase detector (FPLL) and fed via the loop filter to the first variable capacitor. This control voltage is amplified and additionally converted into a current which represents the AFC output signal. At centre frequency the AFC output current is equal to zero.

For TDA9818: the VCO centre frequency can be decreased (required for L accent standard) by activating an additional internal capacitor. This is achieved by using the L accent switch. In this event the second variable capacitor can be controlled by a variable resistor at the L accent switch for setting the VCO centre frequency to the required L accent value.

The oscillator signal is divided by 2 with a TWD which generates two differential output signals with a 90 degree phase difference independent of the frequency.

Video demodulator and amplifier

The video demodulator is realized by a multiplier which is designed for low distortion and large bandwidth. The vision IF input signal is multiplied with the 'in phase' signal of the travelling wave divider output. In the demodulator stage the video signal polarity can be switched in accordance with the TV standard.

The demodulator output signal is fed via an integrated low-pass filter for attenuation of the carrier harmonics to the video amplifier. The video amplifier is realized by an operational amplifier with internal feedback and high bandwidth. A low-pass filter is integrated to achieve an attenuation of the carrier harmonics for B/G and L standard. The standard dependent level shift in this stage delivers the same sync level for positive and negative modulation. The video output signal at $V_{(vid)}$ is 1.1 V (p-p) for nominal vision IF modulation, in order to achieve 1 V (p-p) at sound trap output.

Single/multistandard VIF/SIF-PLL and FM-PLL/AM demodulators

TDA9817; TDA9818

SIF amplifier and SIF AGC

The sound IF amplifier consists of two AC-coupled differential amplifier stages. Each differential stage comprises a controlled feedback network provided by emitter degeneration.

The SIF AGC detector is related to the SIF input signal (average level of AM or FM carrier) and controls the SIF amplifier to provide a constant SIF signal to the AM demodulator and single reference QSS mixer.

At L standard (AM sound) the SIF AGC reaction time is set to 'slow' for nominal video conditions. But with a decreasing VIF amplitude step the SIF AGC is set to 'fast' mode controlled by the VIF AGC detector. In FM mode this reaction time is always 'fast'.

Single reference QSS mixer

The single reference QSS mixer is realized by a multiplier. The SIF amplifier output signal is fed to the single reference QSS mixer and converted to intercarrier frequency by the regenerated picture carrier (VCO).

The mixer output signal is fed via a high-pass for attenuation of the video signal components to the output pin 12. With this system a high performance hi-fi stereo sound processing can be achieved.

For a simplified application without a sound IF SAW filter the single reference QSS mixer can be switched to the intercarrier mode by connecting pin 24 to ground. In this mode the sound IF passes the vision IF SAW filter and the composite IF signal is fed to the single reference QSS mixer. This IF signal is multiplied with the 90 degree TWD output signal for converting the sound IF to intercarrier frequency. This composite intercarrier signal is fed to the output pin 12, too. By using this quadrature detection, the low frequency video signals are removed.

AM demodulator

The AM demodulator is realized by a multiplier. The modulated SIF amplifier output signal is multiplied in phase with the limited (AM is removed) SIF amplifier output signal. The demodulator output signal is fed via an integrated low-pass filter for attenuation of the carrier harmonics to the AF amplifier.

FM-PLL demodulator

The FM-PLL demodulator consists of a limiter and an FM-PLL. The limiter provides the amplification and limitation of the FM sound intercarrier signal. The result is high sensitivity and AM suppression. The amplifier

consists of 7 stages which are internally AC-coupled in order to minimize the DC offset.

Furthermore the AF output signal can be muted by connecting a resistor between the limiter input pin 13 and ground.

The FM-PLL consists of an integrated relaxation oscillator, an integrated loop filter and a phase detector.

The oscillator is locked to the FM intercarrier signal, output from the limiter. As a result of locking, the oscillator frequency tracks with the modulation of the input signal and the oscillator control voltage is superimposed by the AF voltage. The FM-PLL operates as an FM demodulator.

AF signal processing

The AF amplifier consists of two parts:

1. The AF pre-amplifier for FM sound is an operational amplifier with internal feedback, high gain and high common mode rejection. The AF voltage from the PLL demodulator, by principle a small output signal, is amplified by approximately 33 dB. The low-pass characteristic of the amplifier reduces the harmonics of the intercarrier signal at the sound output terminal pin 9 at which the de-emphasis network for FM sound is applied. An additional DC control circuit is implemented to keep the DC level constant, independent of process spread.
2. The AF output amplifier (10 dB) provides the required output level by a rail-to-rail output stage. This amplifier makes use of an input selector for switching to AM, FM de-emphasis or mute state, controlled by the standard switching voltage and the mute switching voltage.

Internal voltage stabilizer

The bandgap circuit internally generates a voltage of approximately 1.25 V, independent of supply voltage and temperature. A voltage regulator circuit, connected to this voltage, produces a constant voltage of 3.6 V which is used as an internal reference voltage.

9.7.7 IC7803: TMP93C071

CMOS 16-Bit Microcontroller TMP93C071F

1. Outline and Feature

TMP93C071F is a high-speed advanced 16-bit microcontroller developed for application with VCR system control, software servo motor control and timer control.

In addition to basics such as I/O ports, the TMP93C071F has high-speed/high-precision signal measuring circuit, PWM (Pulse-Width-Modulator) and high-precision real timing pulse generator.

The device characteristics are as follows:

- (1) Original 16-bit CPU (900L_CPU)
 - TLCS-90 instruction mnemonic upward compatible
 - 16 Mbyte linear address space
 - General-purpose registers and register bank system
 - 16-bit multiplication/division and bit transfer/arithmetic instructions
 - High-speed micro DMA: 4 channels (1.6 μ s / 2 byte at 20 MHz)
- (2) Minimum instruction execution time: 200 ns at 20 MHz
- (3) Internal ROM: ROMless
- (4) Internal RAM: 8 Kbyte
- (5) External memory expansion
 - Can be expanded up to 16 Mbyte (for both programs and data)
 - AM8/16 pin (select the external data bus width)
 - Can be mixed 8 and 16bit external data buses.
 - ...Dynamic data bus sizing.
- (6) 20-bit time-base-counter (TBC)
 - free running counter
 - accuracy: 100 ns (at 20 MHz)
 - overflow: 105 ms (at 20 MHz)
- (7) 8-bit timer (TC0): 1 channel
 - for CTL linear time counter
- (8) 16-bit timer (TC1-5): 5 channels
 - C-sync count, capstan FG count, general: (3 channels)
- (9) Timing pulse generator (TPG): 2 channels
 - (16-bit timing data + 6-bit-output data) with 8-stages FIFO: 1 channel
 - (16-bit timing data + 4-bit-output data): 1 channel
 - accuracy: 400 ns (at 20 MHz)
- (10) Pulse width modulation outputs (PWM)
 - 14-bit PWM: 3 channels (for controlling capstan, drum and tuner)
 - 8-bit PWM: 9 channels (for controlling volume)
 - carrier frequency: 39.1 kHz (at 20 MHz)

980910EBP1

- For a discussion of how the reliability of microcontrollers can be predicted, please refer to Section 1.3 of the chapter entitled Quality and Reliability Assurance / Handling Precautions.
- TOSHIBA is continually working to improve the quality and the reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to observe standards of safety, and to avoid situations in which a malfunction or failure of a TOSHIBA product could cause loss of human life, bodily injury or damage to property. In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent products specifications. Also, please keep in mind the precautions and conditions set forth in the TOSHIBA Semiconductor Reliability Handbook.
- The products described in this document are subject to the foreign exchange and foreign trade laws.
- The information contained herein is presented only as a guide for the applications of our products. No responsibility is assumed by TOSHIBA CORPORATION for any infringements of intellectual property or other rights of the third parties which may result from its use. No license is granted by implication or otherwise under any intellectual property or other rights of TOSHIBA CORPORATION or others.
- The information contained herein is subject to change without notice.

- (11) 24-bit time base counter capture circuit (Capture 0)
 - (18-bit timing data + 6-bit trigger data) with 8-stages FIFO: 1 channel
 - capture input sources: Remote-control-input (RMTIN), V-sync, CTL, Drum-PG, general (1 channel)
 - accuracy: 400 ns (at 20 MHz)
- (12) 17-bit time base counter capture circuit (Capture 1/2)
 - (16-bit timing data + 1-bit trigger data): 2 channel
 - capture input sources: Drum-FG, Capstan-FG
 - accuracy: 100 ns (at 20 MHz)
- (13) VISS/VASS detection circuit (VISS/VASS)
 - CTL duty detection
 - VASS data 16-bit latch
- (14) Composite-sync-signal (C-sync) input (C-sync In)
 - Vertical-sync-signal (V-sync) separation (V-sepa)
- (15) Head Amp switch/Color Rotary control (HA/CR)
- (16) Pseudo-V/H generator (PV/PH)
- (17) 8-bit A/D converter (ADC): 16 channels
 - Conversion speed: 95states (9.5 μ s at 20 MHz)
- (18) Serial bus I/F
 - 8-bit synchronous (SIO0, 1): 2 channels
 - UART: 1 channel
 - I²CBUS: 1 channel/2 ports
 - • • • • Multi - Master function/Master transfer with micro DMA.
- (19) Watch dog timer (WDT)
- (20) Interrupt controller (INTC)
 - CPU: 2 sources • • • SWI instruction, and illegal instruction
 - Internal: 20 sources  7-level priority can be set.
 - External: 5 sources 
- (21) I/O ports
 - 57 I/O ports (multiplexed functional pins)
 - 8 Input ports (P40/AIN3-P47/AIN10: These pins are used as analog input for A/D converter.)
 - 4 Output ports (P24/A20-P27/A23: These pins are also used as address bus outputs.)
- (22) Standby function: 4 halt modes (RUN, IDLE2, IDLE1, STOP)
- (23) System clock function
 - Dual clock operation 20 MHz (High-speed: normal)/32 kHz(Low-speed: slow)
 - • • • • 17-bit Real Time Counter built in
- (24) Operating Voltage
 - Vcc = 2.7 to 5.5 V (at 32 kHz)
 - Vcc = 4.5 to 5.5 V (at 20 MHz)
- (25) Package
 - 120 pin QFP 28 mm \times 28 mm (Pin pitch: 0.8 mm)
 - Type name QFP120-P-2828-0.80A

2. Pin Assignment And Functions

The assignment of input and output pins for the TMP93C071, their names and functions are described below.

2.1 Pin Assignment

Figure 2.1.1 shows pin assignment of the TMP93C071.

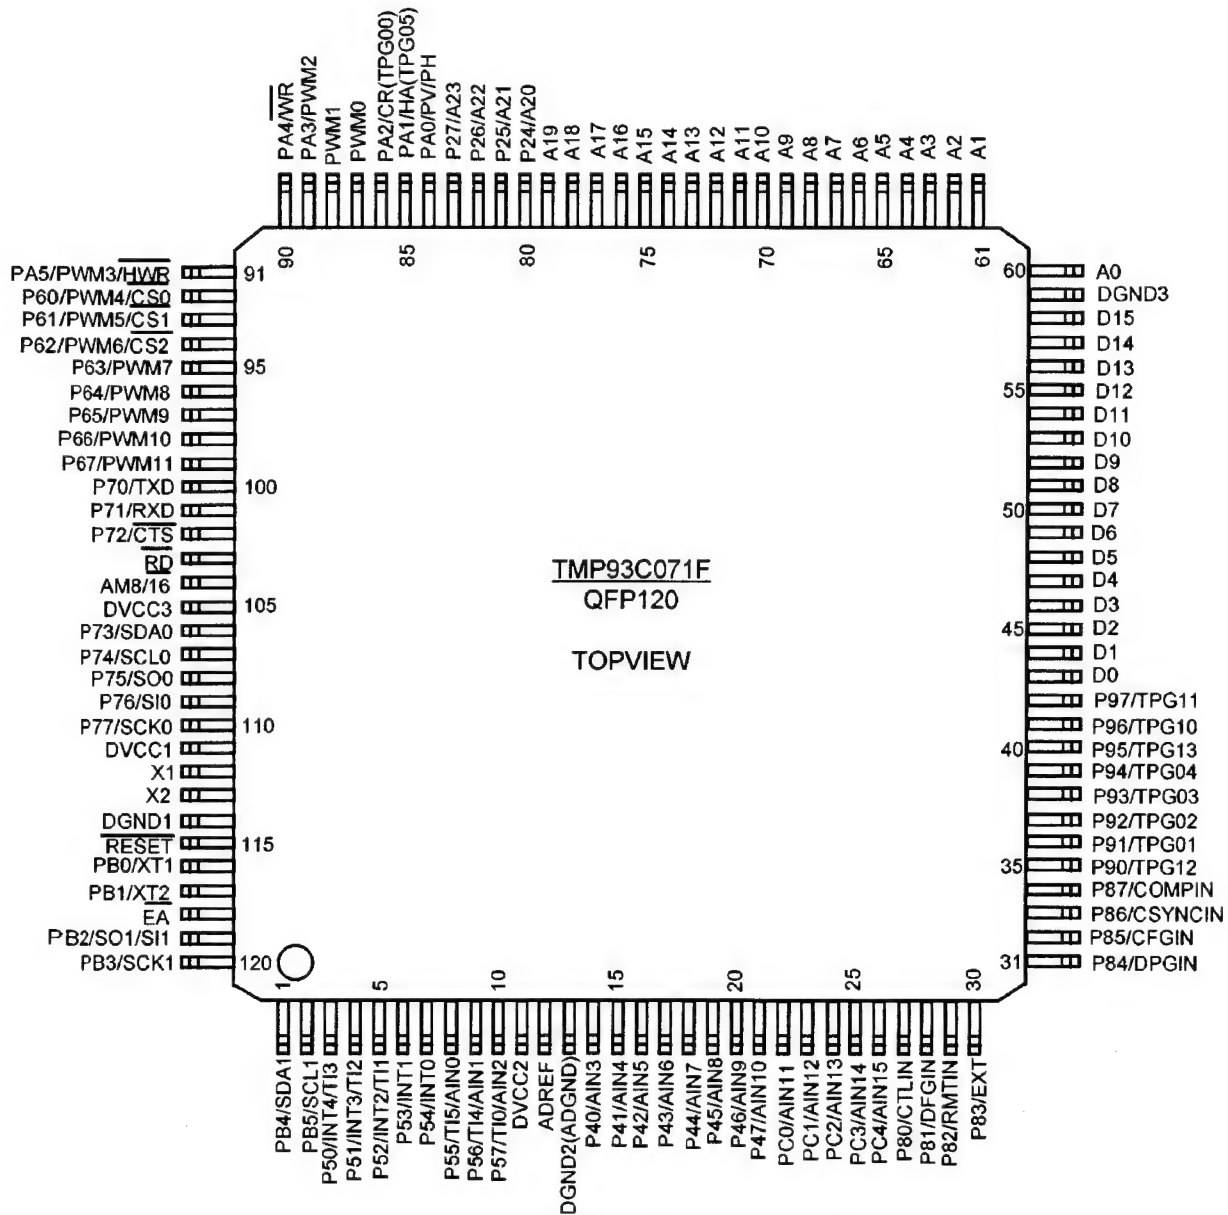

Figure 2.1.1 Pin Assignment (120-pin QFP)

2.2 Pin Names and Functions

The names of input/output pins and their functions are described below.

Table 2.2.1 Pin Names and Function (1/5)

Pin name	Number of pins	I/O	Functions
D0 to D15	16	I/O (3-state)	data: 0 to 15 for data bus
A0 to A19	20	Output	Address: 0 to 19 for address bus
A20 to A23/ P24 to P27	4	Output Output	Address: 20 to 23 for address bus Port 2: Output port
\overline{RD}	1	Output	Read: strobe signal for reading external memory
AM8/16	1	Input	data bus width select input (only 8 bit or 8 bit/16 bit)
PC3, 4/ $\overline{16}$ AIN14, 15	2	I/O Input	Port C3, 4: I/O port that allows selection of I/O on a bit basis. Analog Input: Analog input signal for A/D converter
\overline{EA}	1	Input	External access: Always set to $\overline{0}$
\overline{RESET}	1	Input	Reset: Initializes LSI.(with pull-up R)
X1/X2	2	I/O	High Frequency Oscillator connecting pins (20 MHz)
PB0/ XT1	1	I/O Input	Port B0: I/O port (Open Drain Output) Low Frequency Oscillator connecting pin (32 kHz)
PB1/ XT2	1	I/O Output	Port B1: I/O port (Open drain Output) Low Frequency Oscillator connecting pin
ADREF	1	Input	A/D reference Voltage input

DVCC1, 2, 3	3		Power supply pins All of these pins should be connected to power source.
DGND1, DGND2 (ADGND), DGND3	3		GND pins (0 V) All of these pins should be connected to GND (0 V) line. DGND2 are also used as ADGND for A/D converter.

STV5348

- COMPLETE TELETEXT AND VPS DECODER INCLUDING AN 8 PAGE MEMORY ON A SINGLE CHIP
- UPWARD SOFTWARE COMPATIBLE WITH PREVIOUS SGS-THOMSON's MULTICHIP SOLUTIONS (SAA5231, SDA5243, STV5345)
- PERFORM PDC SYSTEM A (VPS) AND PDC SYSTEM B (8/30/2) DATA STORAGE SEPARATLY
- DEDICATED "ERROR FREE" OUTPUT FOR VALID PDC DATA
- INDICATION OF LINE 23 FOR EXTERNAL USE
- SINGLE +5V SUPPLY VOLTAGE
- SINGLE 13.875MHz CRYSTAL
- REDUCED SET OF EXTERNAL COMPONENTS, NO EXTERNAL ADJUSTMENT
- OPTIMIZED NUMBER OF DIGITAL SIGNALS REDUCING EMC RADIATION
- HIGH DENSITY CMOS TECHNOLOGY
- DIGITAL DATA SLICER AND DISPLAY CLOCK PHASE LOCK LOOP
- 28 PIN DIP & SO PACKAGE

DESCRIPTION

The STV5348 decoder is a computer-controlled teletext device including an 8 page internal memory. Data slicing and capturing extracts the teletext information embedded in the composite video signal. Control is accomplished via a two wire serial I²C bus ®. Chip address is 22h. Internal ROM provides a character set suitable to display text using up to seven national languages. Hardware and software features allow selectable master/slave synchronization configurations. The STV5348 also supports facilities for reception and display of current level protocol data.

BLOCK DIAGRAM

VHF/UHF television tuner

UV1336K MK3

FEATURES

- Member of UV1300 MK3 family of small-sized UHF/VHF tuners
- Integrated with passive splitter
- Covers systems M, N
- Digitally-controlled (PLL) tuning via I²C-bus
- Fast 400kHz I²C bus protocol compatible with 3.3V and 5V micro controllers
- 181 channels coverage (Off-air and full cable)
- World standardized mechanical dimensions and pinning. Horizontal mounting is optionally available.

DESCRIPTION

- The UV1336K MK3 splitter - tuner belongs to the UV1300 family of WSP tuners, which are designed to meet a wide range of TV applications. It is a full band tuner suitable for NTSC M, N and PAL M, N. The low IF output impedance is designed for direct drive of a wide variety of SAW filters with sufficient suppression of triple transient.
- The UV1336K MK3 incorporates internal wideband-AGC with selectable TOP adjustment via I²C.
- This tuner complies with the requirements of radiation, conforming with:
- FCC Part 15, Subpart B
 - BETS 7
 - CISPR13

MARKING

- The following items of information are printed on a sticker that is on the top cover of the tuner:
- Type number
 - Code number
 - Origin letter of factory
 - Change code
 - Year and week code

VERSATILE STREAM MANAGER

GENERAL DESCRIPTION

The Versatile Stream Manager (VSM) is an ASIC used in the first generation DVD Video Recorder. Main function of the VSM is to interface directly to the different hardware modules such as Basic Engine, MPEG encoders, MPEG decoders and buffering the data streams that are coming from or going to these hardware modules.

The VSM contains a memory interface to support one 4M*16 SDRAM device. A host interface allows a CPU to directly access this memory and the VSM's internal registers.

Handling of data streams is done using scatter / gather DMA's under software control. Hardware support is provided in the VSM to support software MPEG AV multiplexing.

FEATURES

The VSM features include:

- SDRAM memory interface to support one 4 banks*1M*16 (64Mbit) SDRAM device.
- Glueless Host Interface for STM's STi5505.
- Glueless MPEG Decoder interface for STM's STi5505
- Glueless interface to Philips SAA6750 MPEG Video Encoder or SAA6752 MPEG AV Encoder.
- Glueless interface to Motorola's DSP56362 used as MPEG Audio Encoder.
- Glueless interface to Philips HDR65 as part of Basic Engine interface including the Sector Processor as also included in the STi5505.
- Audio Clock Control providing PLL loop and clock lock detection.
- Double Extraction of VBI decoded data from extended CCIR 656 stream.
- Double UART with hardware handshake and 8 byte Rx/Tx FIFO.
- Generation of additional Host Bus to support Audio Encoder DSP56362.
- Descriptor based DMA Controllers for data stream handling.
- Hardware support for software MPEG multiplex process.
- Internal Interrupt Controller to handle internal and 4 external interrupt sources.
- Operates from single 27 MHz clock input.
- JTAG for production tests.
- 3.3V logic core.
- 3.3V / 5V toleration IO pins.
- 208 PIN LQFP Package. (CR1087)

BLOCK DIAGRAM

Figure 2.1 shows the block diagram of the VSM. The hardware blocks can be divided in to three categories:

- General modules: Host Interface, Memory Interface, Interrupt Controller.
- DMA Controllers.
- Functional Interfaces; the link between the actual external hardware interface and the DMA Controller. Some Functional Interfaces have knowledge about the stream coming through in order to perform for example MPEG stream characteristics extraction and insertion.

SYNCHRONOUS DRAM

MT48LC16M4A2 – 4 Meg x 4 x 4 banks

MT48LC8M8A2 – 2 Meg x 8 x 4 banks

MT48LC4M16A2 – 1 Meg x 16 x 4 banks

For the latest data sheet, please refer to the Micron web
site: www.micronsemi.com/datasheets/sdramds.html

FEATURES

- PC66-, PC100- and PC133-compliant
- Fully synchronous; all signals registered on positive edge of system clock
- Internal pipelined operation; column address can be changed every clock cycle
- Internal banks for hiding row access/precharge
- Programmable burst lengths: 1, 2, 4, 8 or full page
- Auto Precharge, includes CONCURRENT AUTO PRECHARGE, and Auto Refresh Modes
- Self Refresh Modes: standard and low power
- 64ms, 4,096-cycle refresh
- LVTTL-compatible inputs and outputs
- Single +3.3V $\pm 0.3V$ power supply

64Mb SDRAM PART NUMBERS

PART NUMBER	ARCHITECTURE
MT48LC16M4A2TG	16 Meg x 4
MT48LC8M8A2TG	8 Meg x 8
MT48LC4M16A2TG	4 Meg x 16

GENERAL DESCRIPTION

The 64Mb SDRAM is a high-speed CMOS, dynamic random-access memory containing 67,108,864 bits. It is internally configured as a quad-bank DRAM with a synchronous interface (all signals are registered on the positive edge of the clock signal, CLK). Each of the x4's 16,777,216-bit banks is organized as 4,096 rows by 1,024 columns by 4 bits. Each of the x8's 16,777,216-bit banks is organized as 4,096 rows by 512 columns by 8 bits. Each of the x16's 16,777,216-bit banks is organized as 4,096 rows by 256 columns by 16 bits.

Read and write accesses to the SDRAM are burst oriented; accesses start at a selected location and continue for a programmed number of locations in a programmed sequence. Accesses begin with the registration of an ACTIVE command, which is then followed by a READ or WRITE command. The address bits registered coincident with the ACTIVE command are used to select the bank and row to be accessed (BA0, BA1 select the bank; A0-A11 select the row). The address bits registered coincident with the READ or WRITE

command are used to select the starting column location for the burst access.

The SDRAM provides for programmable READ or WRITE burst lengths of 1, 2, 4, or 8 locations, or the full page, with a burst terminate option. An auto precharge function may be enabled to provide a self-timed row precharge that is initiated at the end of the burst sequence.

The 64Mb SDRAM uses an internal pipelined architecture to achieve high-speed operation. This architecture is compatible with the $2n$ rule of prefetch architectures, but it also allows the column address to be changed on every clock cycle to achieve a high-speed, fully random access. Precharging one bank while accessing one of the other three banks will hide the precharge cycles and provide seamless, high-speed, random-access operation.

The 64Mb SDRAM is designed to operate in 3.3V memory systems. An auto refresh mode is provided, along with a power-saving, power-down mode. All inputs and outputs are LVTTTL-compatible.

SDRAMs offer substantial advances in DRAM operating performance, including the ability to synchronously burst data at a high data rate with automatic column-address generation, the ability to interleave between internal banks in order to hide precharge time and the capability to randomly change column addresses on each clock cycle during a burst access.

STi5508

DVD HOST PROCESSOR WITH ENHANCED AUDIO FEATURES

■ Integrated 32-bit host CPU @ 60MHz

- 2 Kbytes of Icache, 2 Kbytes of Dcache, and 4Kbytes of SRAM configurable as Dcache.

■ Audio decoder

- 5.1 channel Dolby Digital® /MPEG-2 multi-channel decoding, 3 X 2-channel PCM outputs
- IEC60958 -IEC61937 digital output
- SRS®/TruSurround®
- DTS digital out and MP3 decoding

■ Karaoke processor

- Echo, pitch shift, microphone inputs, voice cancellation and multiple other effects

■ Video decoder

- Supports MPEG-2 MP@ML
- Fully programmable zoom-in and zoom-out
- PAL to NTSC and NTSC to PAL conversion

■ DVD and SVCD subpicture decoder

■ High performance on-screen display

- 2 to 8 bits per pixel OSD options
- Anti-flicker, anti-flutter and anti-aliasing filters

■ PAL/NTSC/SECAM encoder

- RGB, CVBS, Y/C and YUV outputs with 10-bit DACs
- Macrovision® 7.01/6.1 compatible

■ Shared SDRAM memory interface

- Supports 1 or 2x16Mbit, or 1x64Mbit 125MHz SDRAM

■ Programmable CPU memory interface for SDRAM, ROM, peripherals...

■ Front-end interface

- DVD, VCD, SVCD and CD-DA compatible
- Serial, parallel and ATAPI interfaces
- Hardware sector filtering
- Integrated CSS decryption and track buffer

■ Integrated peripherals

- 2 UARTS, 2 SmartCards, I2C controller, 3 PWM outputs, 3 capture timers
- Modem support
- 38 bits of programmable I/O

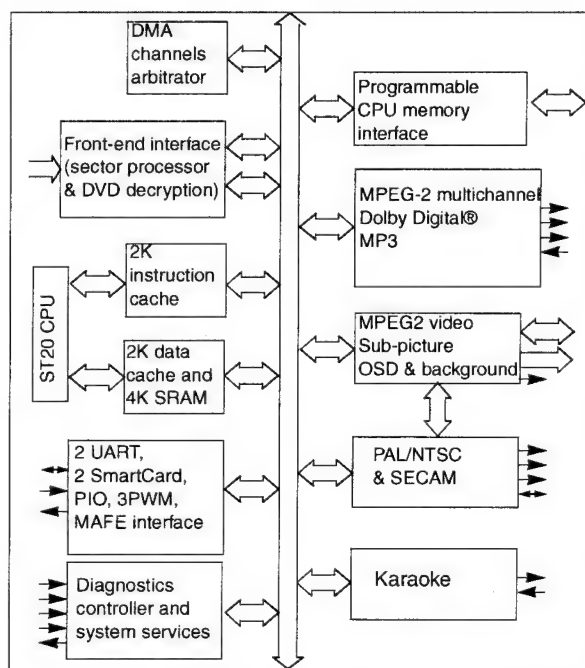

■ Professional toolset support

- ANSI C compiler and libraries

■ 208 pin PQFP package

The STi5508 provides a highly integrated back-end solution for DVD applications. A host CPU handles both the general application (the user interface, and the DVD, CD-DA, VCD, SVCD navigation) and the drivers of the different embedded peripheral (audio/video, karaoke, sub-picture decoders, OSD, PAL/NTSC encoder...).

Because of its memory savings, increased number of internal peripherals, improved development platform and reference design, the STi5508 offers a cost-effective solution to DVD applications, with rapid time-to-market.

STi5508

1 Architecture overview

1 Architecture overview

1.1 Introduction

The figure below shows the architecture of the STi5508. This device has the same global architecture as the STi5505, with the addition of new features such as karaoke, a shared SDRAM memory interface and extra display planes. Because of this increased performance, the STi5508 and STi5505 are not pin compatible. This chapter gives a brief overview of each of the functional blocks of the STi5508.

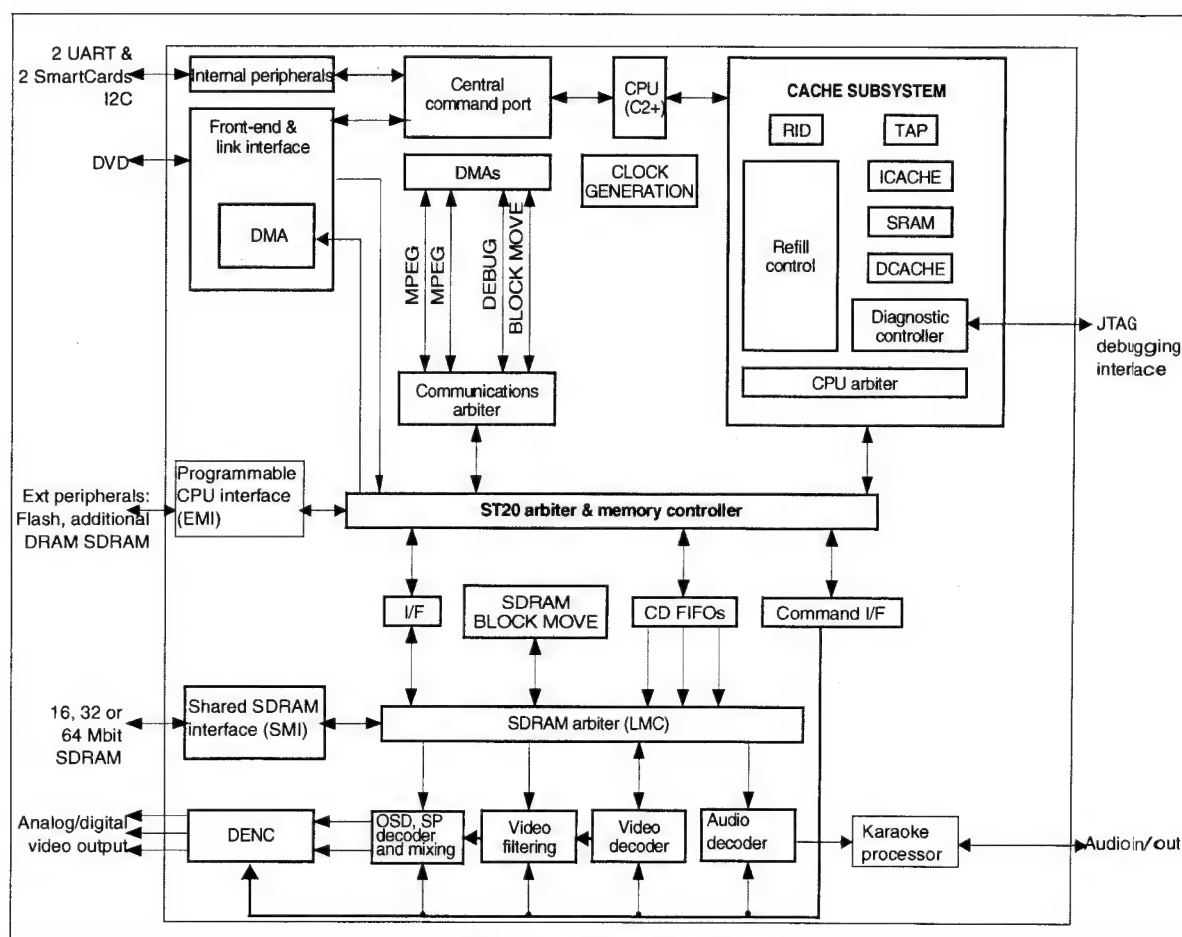

Figure 1 Functional block diagram

1 Architecture overview

STi5508

1.2 Central processor

The STi5508 Central Processing Unit is a ST20C2+ 32-bit processor core. It contains instruction processing logic, instruction and data pointers, and an operand register. It directly accesses the high-speed on-chip SRAM, which can store data or programs and uses the cache to reduce access time to off-chip program and data memory.

The processor can access memory via the Programmable CPU Interface (often referred to as the EMI) or the Shared Memory Interface (SMI), which is shared with the video, audio, sub-picture and OSD decoders.

1.3 MPEG video decoder

This is a real-time video compression processor supporting the MPEG-1 and MPEG-2 standards at video rates up to 720 x 480 x 60 Hz and 720 x 576 x 50 Hz. Picture format conversion for display is performed by vertical and horizontal filters. User-defined bitmaps can be super-imposed on the display picture by using the on-screen display function.

The display unit is part of the MPEG video decoder, it overlays the four display planes shown in the figure below. The display planes are normally overlaid in the order illustrated, with the background color at the back and the sub-picture at the front (used as a cursor plane). The sub-picture plane can alternatively be positioned between the OSD and MPEG video planes where it can be used as a second on-screen display plane.

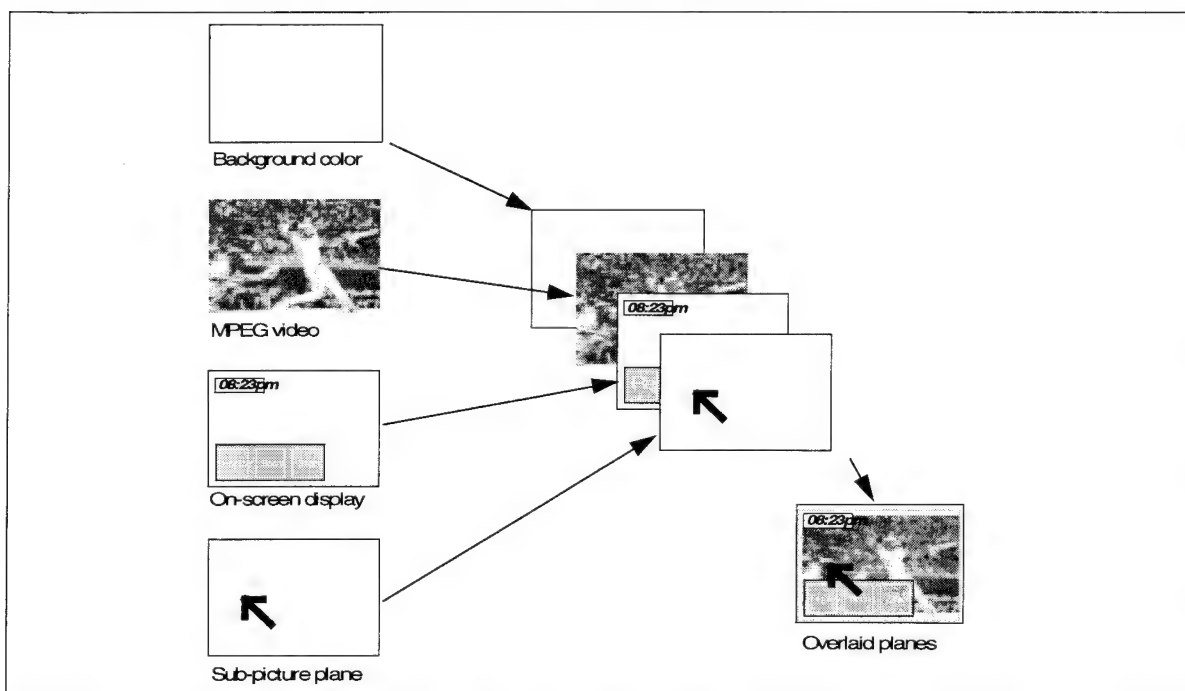

Figure 2 Display planes

STi5508**1 Architecture overview****1.4 Audio decoder**

The audio decoder accepts: Dolby Digital, MPEG-1 layers I and II, MPEG-2 layer II 6-channel, PCM, CDDA data formats; MPEG2 PES streams for MPEG-2, MPEG-1, Dolby Digital, MP3, and Linear PCM (LPCM). The audio decoder supports DTS digital out (DVD DTS and CDDA DTS).

S/PDIF input data (IEC-60958 or IEC-61937 standards) is accepted if an external circuitry extracts the PCM clock from the stream.

Skip frame, repeat blocks and soft mute frame features can be used to synchronize audio and video data. PTS audio extraction is also supported.

The device outputs up to 6 channels of PCM data and appropriate clocks for external digital-to-analog converters.

Programmable downmix enables 1,2,3 or 4 channel outputs. Data can be output in either I²S format or Sony format. The decoder can format output data according to IEC-60958 standard (for non compressed data: L/R channels, 16, 18, 20 and 24-bits) or IEC-61937 standard (for compressed data), for $F_S = 96\text{kHz}$, 48kHz, 44.1kHz or 32kHz.

Sampling frequencies of 96kHz, 48kHz, 44.1kHz, 32kHz and half sampling frequencies are supported. A downsampling filter (96kHz/48kHz) is available.

The decoder supports dual mode for MPEG and Dolby Digital. It is karaoke aware and capable in Dolby Digital and MPEG formats according to DVD specifications. It includes a Dolby surround compatible downmix and a ProLogic decoder.

A pink noise generator enables the accurate positioning of speakers for optimal surround sound setup.

In global mute mode, the decoder decodes the incoming bitstream normally but the PCM and SPDIF outputs are softmuted. This mode is used to prepare a period of decoding mode, to synchronize audio and video data without hearing the audio.

Slow-forward and fast-forward trick modes are available for compressed and non-compressed data.

The control interface of the decoder is activated via memory mapped registers in the ST20 address space.

1.5 Karaoke

The karaoke processor is a post-processing module which supports the following features: 2 micro PCM input pitch shift, echo effect, reverberation, chorus, voice cancellation, level-sensitive vocal cancelling, vocal partnering, independant volume control on music and vocal channels.

1.6 Modem analog front-end interface

The Modem Analog Front-end interface is used to transfer transmit and receive DAC and ADC samples between the memory and an external modem analog front-end (MAFE), using a synchronous serial protocol. DMA is used to transfer the sample data between memory buffers and the MAFE interface module, with separate transmit and receive buffers and double buffering of the buffer pointers. FIFOs are used to take into account the access latency to memory, in a worst case system and to allow the use of bursts for memory bandwidth efficiency improvement. The V22bis standard is supported.

1.7 Memory subsystem**On-chip**

The on-chip memory includes 2Kbytes of instruction cache, 2Kbytes of data cache and 4Kbytes of SRAM that can be optionally configured as data cache. The subsystem provides 240M/bytes of internal bandwidth, supporting pipeline d 2-cycle internal memory access.

1 Architecture overview

STi5508

The instruction and data caches are direct-mapped, with a write-back system for the data-cache. The caches support burst accesses to the external memories for refill and write-back. Burst access increases the performance of page-mode DRAM memories.

Off-chip

There are two off-chip memory interfaces:

- The external memory interface (EMI) accessed by the ST20 is used for the transfer of data and programs between the STi5508 and external peripherals, flash and additional SDRAM and DRAM.
- Shared memory interface (SMI) controls the movement of data between the STi5508 and 16, 32 or 64 Mbits of SDRAM. This external SDRAM stores the display data generated by the MPEG decoder and CPU and the C2+ code data.

The EMI uses minimal external support logic to support memory subsystems, and accesses a 32 Mbytes of physical address space (greater if SDRAM or DRAM is used) in four general purpose memory banks of 8 or 16 bits wide, 21 or 22 address lines, and byte select. For applications requiring extra memory, the EMI supports this extra memory with zero external support logic, even for 16-bit SDRAM devices. The EMI can be configured for a wide variety of timing and decode functions by the configuration registers. The timing of each of the four memory banks can be set separately, with different device types being placed in each bank with no need for external hardware.

1.8 Serial communication

Asynchronous serial controllers

The Asynchronous Serial Controller (ASC), also referred to as the UART interface, provides serial communication between the STi5508 and other microcontrollers, microprocessors or external peripherals. The STi5508 has four ASCs, two of which are generally used by the SmartCard controllers.

Eight or nine bit data transfer, parity generation, and the number of stop bits are programmable. Parity, framing, and overrun error detection increase data transfer reliability. Transmission and reception of data can be double-buffered, or 16-deep FIFOs can be used. A mechanism to distinguish the address from the data bytes is included for multiprocessor communication. Testing is supported by a loop-back option. A 16-bit baud-rate generator provides the ASC with a separate serial clock signal.

Each ASC supports full-duplex asynchronous communication where both the transmitter and the receiver use the same data frame format and the same baud-rate. Each ASC can be set to operate in SmartCard mode for use when interfacing to a SmartCard.

Synchronous serial control

The Synchronous Serial Controller (SSC) provides a high-speed interface to a wide variety of serial memories, remote control receivers and other microcontrollers. The SSC supports all of the features of the Serial Peripheral Interface bus (SPI) and the I²C bus. The SSC can be programmed to interface to other serial bus standards. The SSC shares pins with the parallel input/output (PIO) ports, and support full-duplex and half-duplex synchronous communication when used in conjunction with the PIO configuration.

1.9 Front-end interface

The STi5508 can be connected to a front-end through the following interfaces:

- I2S interface;
- multi-format serial interface;
- multi-format parallel interface;

STi5508**1 Architecture overview**

- ATAPI interface (for DVD-ROMs)

1.10 On-chip PLL

The on-chip PLL accepts 27 MHz input and generates all the internal high-frequency clocks needed for the CPU, MPEG and audio subsystems.

1.11 Diagnostic controller (DCU)

The ST20 Diagnostic Controller Unit (DCU) is used to boot the CPU and to control and monitor the chip systems via the standard IEEE 1194.1 Test Access Port. The DCU includes on-chip hardware with ICE (In Circuit Emulation) and LSA (Logic State Analyzer) features to facilitate verification and debugging of software running on the on-chip CPU in real time. It is an independent hardware module with a private link from the host to support real-time diagnostics.

1.12 Interrupt subsystem

The interrupt system allows an on-chip module or external interrupt pin to interrupt an active process so that an interrupt handling process can be run. An interrupt can be signalled by one of the following: a signal on an external interrupt pin, a signal from an internal peripheral or subsystem, software asserting an interrupt in the pending register.

Interrupts are implemented by an on-chip interrupt controller and an on-chip interrupt-level controller. The interrupt controller supports eight prioritized interrupts as inputs and manages the pending interrupts. This allows the nesting of pre-emptive interrupts for real-time system design. Each interrupt can be programmed to be at a lower or higher priority than the high priority process queue.

1.13 PAL/NTSC/SECAM encoder

The integrated digital encoder converts a multiplexed 4:2:2 or 4:4:4 YCbCr stream into a standard analog baseband PAL/NTSC or SECAM signal and into RGB, YUV, Yc and CVBS components. The encoder can perform closed-caption, CGMS encoding, and allows Macrovision™ 7.01/6.1 copy protection.

1.14 SmartCard interfaces

Two SmartCard interfaces support SmartCards compliant with ISO7816-3. Each interface has a UART (ASC), a dedicated programmable clock generator, and eight bits of parallel IO port.

1.15 PWM and counter module

The PWM and counter module provides three PWM encoder outputs, three PWM decoder (capture) inputs and four programmable timers. Each capture input can be programmed to detect rising edge, falling edge, both edges or neither edge (disabled). These facilities are clocked by two independent clocks, one for PWM outputs and one for capture inputs/timers. The PWM counter is 8-bit, with 8-bit registers to set the output-high time. The capture/compare counter and the compare and capture registers are 32-bit. The module generates a single interrupt signal.

1.16 Parallel I/O module

38 bits of parallel I/O are configured in 5 ports, and each bit is programmable as output or input. The output can be configured as a totem-pole or open-drain driver. The input compare logic can generate an interrupt on any change of any input bit. Many parallel IO have alternate functions and can be connected to an internal peripheral signal such as a UART or SSC.

4. BOOTFROMROM is active during reset.

9.8.4 IC7201: NVRAM

M24C64

M24C32

64/32 Kbit Serial I²C Bus EEPROM

- Compatible with I²C Extended Addressing
- Two Wire I²C Serial Interface
Supports 400 kHz Protocol
- Single Supply Voltage:
 - 4.5V to 5.5V for M24Cxx
 - 2.5V to 5.5V for M24Cxx-W
 - 1.8V to 3.6V for M24Cxx-R
- Hardware Write Control
- BYTE and PAGE WRITE (up to 32 Bytes)
- RANDOM and SEQUENTIAL READ Modes
- Self-Timed Programming Cycle
- Automatic Address Incrementing
- Enhanced ESD/Latch-Up Behavior
- 1 Million Erase/Write Cycles (minimum)
- 40 Year Data Retention (minimum)

DESCRIPTION

These I²C-compatible electrically erasable programmable memory (EEPROM) devices are organized as 8192x8 bits (M24C64) and 4096x8 bits (M24C32), and operate down to 2.5 V (for the -W version of each device), and down to 1.8 V (for the -R version of each device).

The M24C64 and M24C32 are available in Plastic Dual-in-Line, Plastic Small Outline and Thin Shrink Small Outline packages.

Note: 1. NC = Not Connected

Figure 2B. SO Connections

These memory devices are compatible with the I²C extended memory standard. This is a two wire serial interface that uses a bi-directional data bus and serial clock. The memory carries a built-in 4-bit unique Device Type Identifier code (1010) in accordance with the I²C bus definition.

The memory behaves as a slave device in the I²C protocol, with all memory operations synchronized by the serial clock. Read and Write operations are initiated by a START condition, generated by the bus master. The START condition is followed by a Device Select Code and \overline{RW} bit (as described in Table 3), terminated by an acknowledge bit.

When writing data to the memory, the memory inserts an acknowledge bit during the 9th bit time, following the bus master's 8-bit transmission.

Table 2. Absolute Maximum Ratings ¹

Symbol	Parameter	Value	Unit
T _A	Ambient Operating Temperature	-40 to 125	°C
T _{STG}	Storage Temperature	-65 to 150	°C
T _{LEAD}	Lead Temperature during Soldering	PSDIP8: 10 sec SO8: 40 sec TSSOP14: t.b.c.	°C
V _{IO}	Input or Output range	-0.6 to 6.5	V
V _{CC}	Supply Voltage	-0.3 to 6.5	V
V _{ESD}	Electrostatic Discharge Voltage (Human Body model) ²	4000	V

Note: 1. Except for the rating "Operating Temperature Range", stresses above those listed in the Table "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the ST SURE Program and other relevant quality documents.

M29W160DB**16 Mbit (2Mb x8 or 1Mb x16, Boot Block)**
3V Supply Flash Memory

PRELIMINARY DATA

FEATURES SUMMARY

- SINGLE 2.7 to 3.6V SUPPLY VOLTAGE for PROGRAM, ERASE and READ OPERATIONS
- ACCESS TIME: 70ns
- PROGRAMMING TIME
 - 10µs per Byte/Word typical
- 35 MEMORY BLOCKS
 - 1 Boot Block (Top or Bottom Location)
 - 2 Parameter and 32 Main Blocks
- PROGRAM/ERASE CONTROLLER
 - Embedded Program and Erase algorithms
- ERASE SUSPEND and RESUME MODES
 - Read and Program another Block during Erase Suspend
- UNLOCK BYPASS PROGRAM COMMAND
 - Faster Production/Batch Programming
- TEMPORARY BLOCK UNPROTECTION MODE
- SECURITY MEMORY BLOCK
- LOW POWER CONSUMPTION
 - Standby and Automatic Standby
- 100,000 PROGRAM/ERASE CYCLES per BLOCK
- ELECTRONIC SIGNATURE
 - Manufacturer Code: 0020h
 - Top Device Code M29W160DT: 22C4h
 - Bottom Device Code M29W160DB: 2249h

Figure 1. Packages

M29W160DT, M29W160DB**SUMMARY DESCRIPTION**

The M29W160D is a 16 Mbit (2Mb x8 or 1Mb x16) non-volatile memory that can be read, erased and reprogrammed. These operations can be performed using a single low voltage (2.7 to 3.6V) supply. On power-up the memory defaults to its Read mode where it can be read in the same way as a ROM or EPROM.

The memory is divided into blocks that can be erased independently so it is possible to preserve valid data while old data is erased. Each block can be protected independently to prevent accidental Program or Erase commands from modifying the memory. Program and Erase commands are written to the Command Interface of the memory. An on-chip Program/Erase Controller simplifies the process of programming or erasing the memory by taking care of all of the special operations that are required to update the memory contents.

The end of a program or erase operation can be detected and any error conditions identified. The

command set required to control the memory is consistent with JEDEC standards.

The blocks in the memory are asymmetrically arranged, see Tables 2 and 3, Block Addresses. The first or last 64 Kbytes have been divided into four additional blocks. The 16 Kbyte Boot Block can be used for small initialization code to start the microprocessor, the two 8 Kbyte Parameter Blocks can be used for parameter storage and the remaining 32K is a small Main Block where the application may be stored.

Chip Enable, Output Enable and Write Enable signals control the bus operation of the memory. They allow simple connection to most microprocessors, often without additional logic.

The memory is offered in TSOP48 (12 x 20mm), SO44 and LFBGA48 (0.8mm pitch) packages and it is supplied with all the bits erased (set to '1').

Figure 2. Logic Diagram

Note: \overline{RB} not available on SO44 package.

MPEG-2 video and MPEG-audio/AC-3 audio encoder with multiplexer

SAA6752HS

1 FEATURES

1.1 Video input and preprocessing

- Digital YUV input according to "ITU-R BT.656" (8 bits at 27 MHz) and "ITU-R BT.601"
- Support of enhanced "ITU-R BT.656" input format containing decoded VBI data readable via I²C-bus; Closed Caption (CC), Wide Screen Signalling (WSS) and copyright information [Copy Generation Management System (CGMS)]
- Processing of non broadcast video signals from analog VCR according to IEC 756
- Two video clock input pins for switching two digital video sources
- "ITU-R BT.601" format conversion to 1/2D1, 2/3D1 and Standard Interchange Format (SIF)
- 4 : 2 : 2 to 4 : 2 : 0 colour format conversion
- Decimation filtering for all format conversions
- Adaptive median filter and motion compensated filter for input noise reduction.

1.2 Video compression

- Real time MPEG-2 encoding compliant to Main Profile at Main Level (MP@ML) for 625 and 525 interlaced line systems
- Supported resolutions: D1, 2/3D1, 1/2D1 and SIF
- IPB frame, IP frame and I frame only encoding supported at all modes
- Supported bit rates: up to 25 Mbit/s I-only encoding; up to 15 Mbit/s IP-only or IBP encoding.
- Variable video bit rate mode for constant picture quality and constant bit rate mode to gain optimum picture quality from a fixed channel transfer rate
- Access to bit rate control parameters whilst encoding to support external real-time control algorithms (e.g. constrained variable bit rate control)
- Programmable Group Of Pictures (GOP) structure
- Innovative motion estimation with wide search range
- Adaptive quantization
- Motion compensated noise filter.

1.3 Audio input

- Audio inputs: I²S format or EIAJ format (16, 18 or 20 bits), master or slave mode at 32, 44.1 and 48 kHz
- Two digital I²S input ports for selection between two digital audio sources

- Audio clock generation: $256/384 \times f_s$ (48 kHz) locked to video frame rate (if video is present)
- Sample rate conversion to 48 kHz (locked to video frame rate) for slave mode operation in all modes except Digital Versatile Disc (DVD) compliant bypass.

1.4 Audio compression

- Dolby®⁽¹⁾ Digital Consumer Encoding (DDCE) also known as AC-3⁽²⁾ 2 channel audio encoding at 256 kbit/s or 384 kbit/s (only for SAA6752HS/01)
- MPEG-1 layer 2 audio encoding at 256 kbit/s or 384 kbit/s
- Input data bypass for Linear Pulse Code Modulation (LPCM) and compressed audio data [MPEG-1, MPEG-2, Dolby® Digital (DD) and Digital Theatre System (DTS)] according to IEC 61937
- Preamble Pc, Preamble Pd and bit stream information captured for identification of modes during bypass of compressed audio data for MPEG-1, MPEG-2, DD and DTS according to IEC 61937
- Audio mute via I²C-bus control for all modes except DVD-compliant bypass.

1.5 Stream multiplexer

- Multiplexing of video and audio streams according to the MPEG-2 systems standard ("ISO 13818-1")
- Generation and output of MPEG-2 Transport Streams (TS), MPEG-2 Program Streams (PS), Packetized Elementary Streams (PES) and Elementary Streams (ES) compliant to the DVD, D-VHS and DVB standards
- MPEG time stamp (PTS/DTS/SCR/PCR) generation and insertion (synchronization)
- Insertion of metadata
- Optional generation of empty time slots for subsequent insertion of application specific data packets
- Optional insertion of user data in the GOP header and in the picture header.

(1) Dolby is a registered trademark of Dolby Laboratories Licensing Corporation.

(2) AC-3 is a registered trademark of Dolby Laboratories Licensing Corporation.

MPEG-2 video and MPEG-audio/AC-3 audio encoder with multiplexer

SAA6752HS

1.6 Output interface

- Parallel interface 8-bit master/slave output
- 3-state output port
- Glueless interfacing with IEEE 1394 chip sets (for example, PDI 1394 L11)
- Data Expansion Bus Interface (DEBI) interface.

1.7 Control domain

- All control done via I²C-bus
- I²C-bus slave transceiver up to 400 kHz
- I²C-bus slave address select pin
- Host interrupt flag pin.

1.8 Other features

- Single external clock or single crystal 27 MHz
- Separate 27 MHz system clock output
- Interface voltage 3.3 V
- TTL compatible digital outputs
- Power supply voltage 3.3 and 2.5 V
- Boundary Scan Test (BST) supported
- Power-down mode
- Single SDRAM system memory (16 Mbit@16 bit or 64 Mbit@16 bit).

2 GENERAL DESCRIPTION

2.1 General

Philips Semiconductors' second generation real time MPEG-2 encoder, the SAA6752HS, is a highly integrated single chip audio and video encoding solution with very flexible multiplexing functionality. With our expertise in two critical areas for consumer video encoding, noise filtering and motion estimation, we have pushed the boundaries for video quality even further, providing enhanced quality for low bit rates and enabling increased recording times for a given storage capacity. The SAA6752HS will also enable a key driver for new consumer digital recording applications; system cost reduction. By integrating all audio encoding and multiplexing functionality we will be moving from a three chip to a one chip system, with cost efficient design and process technology, thus providing a truly low cost, high quality encoding system.

The SAA6752HS/02 is intended for customers whose application does not require the DDCE function.

The SAA6752HS gives significant advantages to customers developing digital recording applications:

- **Fast time-to-market and low development resources:** By adding a simple external video input processor IC, audio analog-to-digital converter, and an external SDRAM, analog video and audio sources are compressed into high quality MPEG-2 video and MPEG-1 layer 2 or AC-3 audio streams, multiplexed into a single program or transport stream for simple connection to various storage media or broadcast media. Hence, making design effort for our customers a minimum, as well as removing the need for in-depth experience in MPEG encoding.
- **Low system host resources:** All video and audio encoding algorithms and software are run on an internal MIPS®(1) processor. The SAA6752HS only requires small amount of communication from system host processor to set up and control required encoding parameters via I²C-bus.

2.2 Application fields

2.2.1 DVD BASED OPTICAL DISC RECORDERS (DVD+RW, DVD-RW, DVD-RAM)

Emerging optical disc based recording systems target to replace the existing consumer recording (VCR) and playback (DVD and VCD) products. The first generation recordable DVD based products will want to maximise recording times for the 4.7 Gbyte storage capacity. For these systems the SAA6752HS is critical, with its superior noise filtering and motion estimation, in enabling high quality at low bit rates.

Playback compatibility with existing DVD decoding solutions will also be important, which is why the SAA6752HS provides Dolby® digital consumer (AC-3) audio encoding to allow playback through existing players implementing DDCE (AC-3) decoding dominant in current DVD platforms.

The DVD stream is based on MPEG Program Stream (PS). The SAA6752HS directly outputs MPEG PS compliant to the DVD standard.

(1) MIPS is a registered trademark of MIPS Technologies.

MPEG-2 video and MPEG-audio/AC-3 audio encoder with multiplexer

SAA6752HS

2.2.2 HDD BASED TIME SHIFT RECORDING

Hard Disc Drive (HDD) based time-shift systems enable Personalized TV (PTV) functionality, providing consumers with new powers of control over what and when to watch broadcast content. With the audio and video content recorded digitally, identification, search and retrieval becomes a 'no brainer' task as compared to traditional VCR functionality. Combine this with electronic program guides and intelligent control, and the PTV can also analyse the viewers watching habits to search for programs likely to be of interest and automatically recorded in anticipation of the viewers preferences.

Since HDD recorders are closed systems, the recording format stream can be proprietary. SAA6752HS flexible multiplexing formats, support a number of recording stream formats for HDD including MPEG Transport Stream (TS) or MPEG Packetized Elementary Stream (PES).

2.2.3 DIGITAL VCR (DVHS) RECORDING

A DVHS player records streams based on MPEG Transport Streams (TS) packed in logical tape tracks. The SAA6752HS output streams are compliant with DVHS standard requirements.

2.2.4 VIDEO EDITING/TRANSMISSION/SURVEILLANCE/ CONFERENCING

The SAA6752HS can operate as a stand-alone device in all above applications. The SAA6752HS' full features and flexibility allows customers to tailor functionality and performance to specific application requirements. All required control settings such as GOP size and bit rate modes can be selected via I²C-bus.

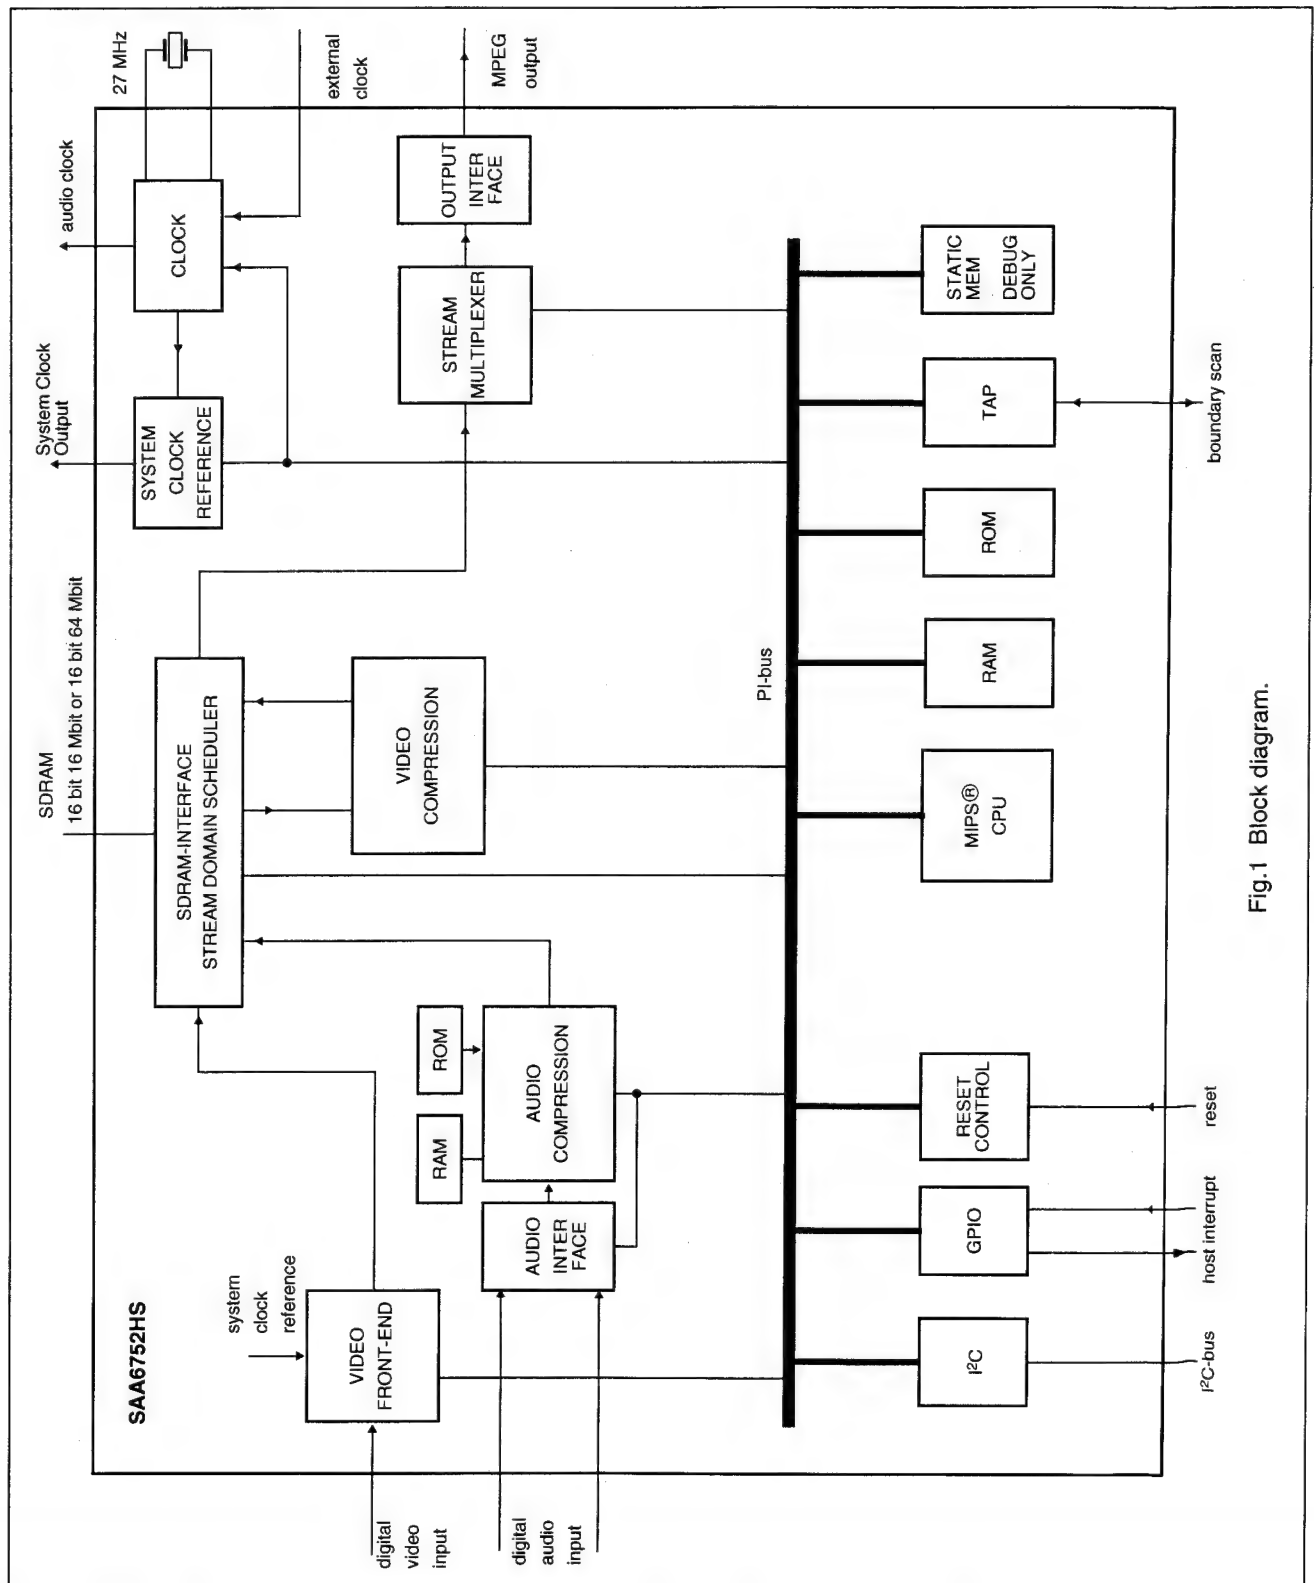

Fig.1 Block diagram.

MPEG-2 video and MPEG-audio/AC-3 audio encoder with multiplexer

SAA6752HS

6 PINNING

SYMBOL	PIN	INPUT/OUTPUT ⁽¹⁾	I _{max} (mA)	DESCRIPTION
V _{SSP}	1	ground	–	pad ground
SDATA1	2	input	–	I ² S-bus serial data input port 1 with internal pull-down resistor
SCLK1	3	input/output	4	I ² S-bus serial clock port 1 with internal pull-down resistor
SWS1	4	input/output	4	I ² S-bus word select port 1 with internal pull-down resistor
V _{DDP}	5	supply	–	pad ring supply voltage (3.3 V)
SDATA2	6	input/output	4	I ² S-bus serial data port 2 with internal pull-down resistor
SCLK2	7	input/output	4	I ² S-bus serial clock port 2 with internal pull-down resistor
SWS2	8	input/output	4	I ² S-bus word select port 2 with internal pull-down resistor
ACLK	9	output	4	audio clock output ($256 \times f_s$ or $384 \times f_s$)
V _{SSP}	10	ground	–	pad ground
IDQ	11	input	–	reserved (recommended connect to pin V _{SSP}) with internal pull-down resistor
YUV0	12	input	–	video input signal bit 0 (LSB)
YUV1	13	input	–	video input signal bit 1
YUV2	14	input	–	video input signal bit 2
YUV3	15	input	–	video input signal bit 3
YUV4	16	input	–	video input signal bit 4
YUV5	17	input	–	video input signal bit 5
YUV6	18	input	–	video input signal bit 6
YUV7	19	input	–	video input signal bit 7 (MSB)
V _{SSP}	20	ground	–	pad ground
HSYNC	21	input	–	horizontal sync input (video) with internal pull-down resistor
VSNC	22	input	–	vertical sync input (video) with internal pull-down resistor
FID	23	input	–	video field identification input (odd/even field) with internal pull-down resistor
VCLK1	24	input	–	video clock input 1 (27 MHz) with internal pull-down resistor
V _{SSCO}	25	ground	–	core ground
V _{SSCO}	26	ground	–	core ground
V _{DDCO}	27	supply	–	core supply voltage (2.5 V)
V _{DDCO}	28	supply	–	core supply voltage (2.5 V)
V _{DDP}	29	supply	–	pad ring supply voltage (3.3 V)
VCLK2	30	input	–	video clock input 2 (27 MHz) with internal pull-down resistor
PDOAV	31	3-state output	4	parallel stream data output for audio/video identifier
PDIDS	32	input	–	parallel stream data input for data strobe (request for packet in Data Expansion Bus Interface (DEBI) slave mode) with internal pull-up resistor
PDOSYNC	33	3-state output	4	parallel stream data output for packet sync
V _{SSP}	34	ground	–	pad ground
PDOVAL	35	3-state output	4	parallel stream data valid output with internal pull-up resistor
PDOO	36	3-state output	4	parallel stream data output bit 0 (LSB)

MPEG-2 video and MPEG-audio/AC-3 audio encoder with multiplexer

SAA6752HS

SYMBOL	PIN	INPUT/OUTPUT ⁽¹⁾	I _{max} (mA)	DESCRIPTION
PDO1	37	3-state output	4	parallel stream data output bit 1
PDO2	38	3-state output	4	parallel stream data output bit 2
V _{DDP}	39	supply	–	pad ring supply voltage (3.3 V)
PDO3	40	3-state output	4	parallel stream data output bit 3
PDO4	41	3-state output	4	parallel stream data output bit 4
PDO5	42	3-state output	4	parallel stream data output bit 5
PDO6	43	3-state output	4	parallel stream data output bit 6
V _{SSP}	44	ground	–	pad ground
PDO7	45	3-state output	4	parallel stream data output bit 7 (MSB)
PDIOCLK	46	input/output	4	parallel stream clock input/output
I2CADDRSEL	47	input	–	I ² C-bus address select input with internal pull-up resistor
SD_DQ15	48	input/output	8	SDRAM data input/output bit 15 (MSB)
V _{DDP}	49	supply	–	pad ring supply voltage (3.3 V)
SD_DQ0	50	input/output	8	SDRAM data input/output bit 0 (LSB)
SD_DQ14	51	input/output	8	SDRAM data input/output bit 14
SD_DQ1	52	input/output	8	SDRAM data input/output bit 1
V _{SSP}	53	ground	–	pad ground
SD_DQ13	54	input/output	8	SDRAM data input/output bit 13
SD_DQ2	55	input/output	8	SDRAM data input/output bit 2
SD_DQ12	56	input/output	8	SDRAM data input/output bit 12
V _{DDP}	57	supply	–	pad ring supply voltage (3.3 V)
SD_DQ3	58	input/output	8	SDRAM data input/output bit 3
SD_DQ11	59	input/output	8	SDRAM data input/output bit 11
SD_DQ4	60	input/output	8	SDRAM data input/output bit 4
SD_DQ10	61	input/output	8	SDRAM data input/output bit 10
V _{SSP}	62	ground	–	pad ground
SD_DQ5	63	input/output	8	SDRAM data input/output bit 5
SD_DQ9	64	input/output	8	SDRAM data input/output bit 9
SD_DQ6	65	input/output	8	SDRAM data input/output bit 6
SD_DQ8	66	input/output	8	SDRAM data input/output bit 8
V _{DDP}	67	supply	–	pad ring supply voltage (3.3 V)
SD_DQ7	68	input/output	8	SDRAM data input/output bit 7
SD_DQM1	69	output	8	SDRAM data mask enable output bit 1
SD_DQM0	70	output	8	SDRAM data mask enable output bit 0 (LSB)
SD_WE	71	output	8	SDRAM write enable output (active LOW)
V _{SSP}	72	ground	–	pad ground
SD_CAS	73	output	8	SDRAM column address strobe output (active LOW)
SD_CLK	74	output	8	SDRAM clock output
SD_RAS	75	output	8	SDRAM row address strobe output (active LOW)
SD_CKE	76	output	8	SDRAM clock enable output

MPEG-2 video and MPEG-audio/AC-3 audio encoder with multiplexer

SAA6752HS

SYMBOL	PIN	INPUT/OUTPUT ⁽¹⁾	I _{max} (mA)	DESCRIPTION
V _{SSCO}	77	ground	–	core ground
V _{SSCO}	78	ground	–	core and substrate ground
V _{DDCO}	79	supply	–	core supply voltage (2.5 V)
V _{DDCO}	80	supply	–	core supply voltage (2.5 V)
V _{DDP}	81	supply	–	pad ring supply voltage (3.3 V)
SD_CS	82	output	8	SDRAM chip select output (active LOW)
SD_A13	83	output	8	SDRAM address output bit 13 (bank selection for 64 Mbit)
SD_A9	84	output	8	SDRAM address output bit 9
SD_A8	85	output	8	SDRAM address output bit 8
V _{SSP}	86	ground	–	pad ground
SD_A11	87	output	8	SDRAM address output bit 11 (bank selection for 16 Mbit)
SD_A7	88	output	8	SDRAM address output bit 7
SD_A12	89	output	8	SDRAM address output bit 12 (bank selection for 64 Mbit)
SD_A6	90	output	8	SDRAM address output bit 6
V _{DDP}	91	supply	–	pad ring supply voltage (3.3 V)
SD_A10	92	output	8	SDRAM address output bit 10
SD_A5	93	output	8	SDRAM address output bit 5
SD_A0	94	output	8	SDRAM address output bit 0 (LSB)
SD_A4	95	output	8	SDRAM address output bit 4
V _{SSP}	96	ground	–	pad ground
SD_A1	97	output	8	SDRAM address output bit 1
SD_A3	98	output	8	SDRAM address output bit 3
SD_A2	99	output	8	SDRAM address output bit 2
SD_DQM3	100	output	8	reserved (do not connect)
V _{DDP}	101	supply	–	pad ring supply voltage (3.3 V)
SD_DQM2	102	output	8	reserved (do not connect)
SD_DQ31	103	input/output	8	reserved (do not connect)
SD_DQ16	104	input/output	8	reserved (do not connect)
V _{SSP}	105	ground	–	pad ground
SD_DQ30	106	input/output	8	reserved (do not connect)
SD_DQ17	107	input/output	8	reserved (do not connect)
SD_DQ29	108	input/output	8	reserved (do not connect)
V _{DDP}	109	supply	–	pad ring supply voltage (3.3 V)
SD_DQ18	110	input/output	8	reserved (do not connect)
SD_DQ28	111	input/output	8	reserved (do not connect)
SD_DQ19	112	input/output	8	reserved (do not connect)
SD_DQ27	113	input/output	8	reserved (do not connect)
V _{SSP}	114	ground	–	pad ground
SD_DQ20	115	input/output	8	reserved (do not connect)
SD_DQ26	116	input/output	8	reserved (do not connect)

MPEG-2 video and MPEG-audio/AC-3 audio encoder with multiplexer

SAA6752HS

SYMBOL	PIN	INPUT/OUTPUT ⁽¹⁾	I _{max} (mA)	DESCRIPTION
V _{SSCO}	77	ground	–	core ground
V _{SSCO}	78	ground	–	core and substrate ground
V _{DDCO}	79	supply	–	core supply voltage (2.5 V)
V _{DDCO}	80	supply	–	core supply voltage (2.5 V)
V _{DDP}	81	supply	–	pad ring supply voltage (3.3 V)
SD_CS	82	output	8	SDRAM chip select output (active LOW)
SD_A13	83	output	8	SDRAM address output bit 13 (bank selection for 64 Mbit)
SD_A9	84	output	8	SDRAM address output bit 9
SD_A8	85	output	8	SDRAM address output bit 8
V _{SSP}	86	ground	–	pad ground
SD_A11	87	output	8	SDRAM address output bit 11 (bank selection for 16 Mbit)
SD_A7	88	output	8	SDRAM address output bit 7
SD_A12	89	output	8	SDRAM address output bit 12 (bank selection for 64 Mbit)
SD_A6	90	output	8	SDRAM address output bit 6
V _{DDP}	91	supply	–	pad ring supply voltage (3.3 V)
SD_A10	92	output	8	SDRAM address output bit 10
SD_A5	93	output	8	SDRAM address output bit 5
SD_A0	94	output	8	SDRAM address output bit 0 (LSB)
SD_A4	95	output	8	SDRAM address output bit 4
V _{SSP}	96	ground	–	pad ground
SD_A1	97	output	8	SDRAM address output bit 1
SD_A3	98	output	8	SDRAM address output bit 3
SD_A2	99	output	8	SDRAM address output bit 2
SD_DQM3	100	output	8	reserved (do not connect)
V _{DDP}	101	supply	–	pad ring supply voltage (3.3 V)
SD_DQM2	102	output	8	reserved (do not connect)

SD_DQ16	104	input/output	8	reserved (do not connect)
V _{SSP}	105	ground	–	pad ground
SD_DQ30	106	input/output	8	reserved (do not connect)
SD_DQ17	107	input/output	8	reserved (do not connect)
SD_DQ29	108	input/output	8	reserved (do not connect)
V _{DDP}	109	supply	–	pad ring supply voltage (3.3 V)
SD_DQ18	110	input/output	8	reserved (do not connect)
SD_DQ28	111	input/output	8	reserved (do not connect)
SD_DQ19	112	input/output	8	reserved (do not connect)
SD_DQ27	113	input/output	8	reserved (do not connect)
V _{SSP}	114	ground	–	pad ground
SD_DQ20	115	input/output	8	reserved (do not connect)
SD_DQ26	116	input/output	8	reserved (do not connect)

MPEG-2 video and MPEG-audio/AC-3 audio encoder with multiplexer

SAA6752HS

SYMBOL	PIN	INPUT/OUTPUT ⁽¹⁾	I _{max} (mA)	DESCRIPTION
SD_DQ21	117	input/output	8	reserved (do not connect)
SD_DQ25	118	input/output	8	reserved (do not connect)
V _{DDP}	119	supply	–	pad ring supply voltage (3.3 V)
SD_DQ22	120	input/output	8	reserved (do not connect)
SD_DQ24	121	input/output	8	reserved (do not connect)
SD_DQ23	122	input/output	8	reserved (do not connect)
EXTCLK	123	input	–	27 MHz external clock input with internal pull-up resistor
V _{SSP}	124	ground	–	pad ground
V _{SSA}	125	ground	–	oscillator analog ground
XTALI	126	analog input	–	crystal oscillator input (27 MHz); note 2
XTALO	127	analog output	–	crystal oscillator output (27 MHz)
V _{DDA}	128	supply	–	oscillator analog supply voltage (2.5 V)
V _{SSCO}	129	ground	–	core ground
V _{SSCO}	130	ground	–	core ground
V _{DDCO}	131	supply	–	core supply voltage (2.5 V)
V _{DDCO}	132	supply	–	core supply voltage (2.5 V)
V _{DDP}	133	supply	–	pad ring supply voltage (3.3 V)
TDI	134	input	–	boundary scan test data input; pin must float or set to HIGH during normal operating; with internal pull-up resistor; note 3
TMS	135	input	–	boundary scan test mode select; pin must float or set to HIGH during normal operating; with internal pull-up resistor; note 3
TCK	136	input	–	boundary scan test clock; pin must be set to LOW during normal operating; with internal pull-up resistor; note 3
TDO	137	3-state output	4	boundary scan test data output; pin not active during normal operating; with 3-state output; note 3
V _{SSP}	138	ground	–	pad ground
TRST	139	input	–	test reset input (active LOW), for boundary scan test (with internal pull-up); notes 3 and 4
CLKOUT	140	output	4	27 MHz system clock output
TEST0	141	input/output	4	reserved (do not connect)
TEST1	142	input/output	4	reserved (do not connect)
V _{DDP}	143	supply	–	pad ring supply voltage (3.3 V)
TEST2	144	input/output	4	reserved (do not connect)
SDA	145	input/open-drain output	–	serial data input/output (I ² C-bus)
SCL	146	input/open-drain output	–	serial clock input/output (I ² C-bus)
RESET	147	input	–	reset input (active LOW); with internal pull-up resistor
V _{SSP}	148	ground	–	pad ground
RTS	149	output	4	reserved (do not connect); Universal Asynchronous Receiver/Transmitter (UART) request to send output (active LOW)

MPEG-2 video and MPEG-audio/AC-3 audio encoder with multiplexer

SAA6752HS

SYMBOL	PIN	INPUT/OUTPUT ⁽¹⁾	I _{max} (mA)	DESCRIPTION
CTS	150	input	–	reserved (recommended connect to pin V _{DDP}); UART clear to send input; external static memory select input (active LOW); with internal pull-up resistor
RXD	151	input	–	reserved (recommended connect to pin V _{DDP}); UART receive data; internal boot select input; with internal pull-up resistor
TXD	152	output	4	reserved (do not connect); UART transmit data
V _{DDP}	153	supply	–	pad ring supply voltage (3.3 V)
SM_LB	154	input/output	4	reserved (do not connect)
SM_UB	155	input/output	4	reserved (do not connect)
H_IRF	156	3-state output	4	host interrupt ?ag output; with internal pull-up resistor
V _{SSP}	157	ground	–	pad ground
SM_OE	158	output	4	reserved (do not connect), static memory output enable output (active LOW)
SM_A9	159	output	4	reserved (do not connect), static memory address output bit 9
SM_A10	160	output	4	reserved (do not connect), static memory address output bit 10
V _{DDP}	161	supply	–	pad ring supply voltage (3.3 V)
SM_A8	162	output	4	reserved (do not connect), static memory address output bit 8
SM_A11	163	output	4	reserved (do not connect), static memory address output bit 11
SM_A7	164	output	4	reserved (do not connect), static memory address output bit 7
SM_A12	165	output	4	reserved (do not connect), static memory address output bit 12
V _{SSP}	166	ground	–	pad ground
SM_A6	167	output	4	reserved (do not connect), static memory address output bit 6
SM_A13	168	output	4	reserved (do not connect), static memory address output bit 13
SM_A5	169	output	4	reserved (do not connect), static memory address output bit 5
SM_A14	170	output	4	reserved (do not connect), static memory address output bit 14
V _{DDP}	171	supply	–	pad ring supply voltage (3.3 V)
SM_WE	172	output	4	reserved (do not connect), static memory write enable output (active LOW)
SM_D7	173	input/output	4	reserved (do not connect), static memory data input/output bit 7 with internal pull-down resistor
SM_D8	174	input/output	4	reserved (do not connect), static memory data input/output bit 8 with internal pull-down resistor
SM_D6	175	input/output	4	reserved (do not connect), static memory data input/output bit 6 with internal pull-down resistor
V _{SSP}	176	ground	–	pad ground
SM_D9	177	input/output	4	reserved (do not connect), static memory data input/output bit 9 with internal pull-down resistor
SM_D5	178	input/output	4	reserved (do not connect), static memory data input/output bit 5 with internal pull-down resistor
SM_D10	179	input/output	4	reserved (do not connect), static memory data input/output bit 10 with internal pull-down resistor

MPEG-2 video and MPEG-audio/AC-3 audio encoder with multiplexer

SAA6752HS

SYMBOL	PIN	INPUT/OUTPUT ⁽¹⁾	I _{max} (mA)	DESCRIPTION
SM_D4	180	input/output	4	reserved (do not connect), static memory data input/output bit 4 with internal pull-down resistor
V _{SSC0}	181	ground	–	internal pre-driver and substrate ground
V _{SSC0}	182	ground	–	core ground
V _{DDC0}	183	supply	–	core supply voltage (2.5 V)
V _{DDC0}	184	supply	–	internal pre-driver supply voltage (2.5 V)
V _{DDP}	185	supply	–	pad ring supply voltage (3.3 V)
SM_D11	186	input/output	4	reserved (do not connect), static memory data input/output bit 11 with internal pull-down resistor
SM_D3	187	input/output	4	reserved (do not connect), static memory data input/output bit 3 with internal pull-down resistor
SM_D12	188	input/output	4	reserved (do not connect), static memory data input/output bit 12 with internal pull-down resistor
SM_D2	189	input/output	4	reserved (do not connect), static memory data input/output bit 2 with internal pull-down resistor
V _{SSP}	190	ground	–	pad ground
SM_D13	191	input/output	4	reserved (do not connect), static memory data input/output bit 13 with internal pull-down resistor
SM_D1	192	input/output	4	reserved (do not connect), static memory data input/output bit 1 with internal pull-down resistor
SM_D14	193	input/output	4	reserved (do not connect), static memory data input/output bit 14 with internal pull-down resistor
SM_D0	194	input/output	4	reserved (do not connect), static memory data input/output bit 0 (LSB) with internal pull-down resistor
V _{DDP}	195	supply	–	pad ring supply voltage (3.3 V)
SM_D15	196	input/output	4	reserved (do not connect), static memory data input/output bit 15 (MSB) with internal pull-down resistor
SM_CS3	197	output	4	reserved (do not connect), static memory chip select output for external ROM or RAM (active LOW)
SM_A4	198	output	4	reserved (do not connect), static memory address output bit 4
SM_A3	199	output	4	reserved (do not connect), static memory address output bit 3
V _{SSP}	200	ground	–	pad ground
SM_A2	201	output	4	reserved (do not connect), static memory address output bit 2
SM_A15	202	output	4	reserved (do not connect), static memory address output bit 15
SM_A1	203	output	4	reserved (do not connect), static memory address output bit 1
SM_A16	204	output	4	reserved (do not connect), static memory address output bit 16
V _{DDP}	205	supply	–	pad ring supply voltage (3.3 V)
SM_A0	206	output	4	reserved (do not connect), static memory address output bit 0 (LSB)
SM_A17	207	output	4	reserved (do not connect), static memory address output bit 17 (MSB)
SM_CS0	208	output	4	reserved (do not connect)

MPEG-2 video and MPEG-audio/AC-3 audio encoder with multiplexer

SAA6752HS**Notes**

1. All input pins, input/output pins (in input mode), output pins (in 3-state mode) and open-drain output pins are limited to 3.3 V.
2. If used with external clock source the input voltage has to be limited to 2.5 V.
3. In accordance with the "IEEE 1149.1" standard.
4. Special function of pin $\overline{\text{TRST}}$:
 - a) For board designs without boundary scan implementation, pin $\overline{\text{TRST}}$ must be connected to ground.
 - b) Pin $\overline{\text{TRST}}$ provides easy initialization of the internal BST circuit. By applying a LOW it can be used to force the internal Test Access Port (TAP) controller to the Test-Logic-Reset state (normal operating) at once.

Fig.2 Pin configuration.

9.8.7 IC7500: SAA7118 (VIP)

PAL/NTSC/SECAM Video Decoder with Adaptive Comb Filter, Component Video Input, VBI-Data Slicer and High Performance Scaler

SAA7118**1 FEATURES**

The SAA7118 is a video capture device for application at the image port of VGA controller, with following feature high lights:

Video Acquisition/ Clock

Up to sixteen analog CVBS, split as desired (All of the CVBS inputs optionally can be used to convert VSB signals)

Up to eight analog Y+C inputs, split as desired

Up to four analog component inputs, with embedded or separate sync, split as desired

Four on-chip anti-aliasing filters in front of the ADC's

Automatic Clamp Control (ACC) for CVBS, Y and C (or VSB) and component signal

Switchable white Peak Control

Four 9 Bit Low Noise CMOS analog-to-digital converters at two-fold ITU-656 oversampling (27 MHz)

Digitized CVBS or Y+C-signals are available on the expansion port

Fully programmable static gain or automatic gain control, matching to the particular signal properties

On-Chip Line Locked Clock Generation according ITU601

Requires only one crystal (32.11 or 24.576 MHz) for all standards

Horizontal and vertical Sync Detection

Video Decoder

Digital PLL for Synchronization and Clock Generation from all Standards and Non- Standard Video Sources e.g. consumer grade VTR

Digital PLL for Synchronization and Clock Generation from all Standards and Non- Standard Video Sources e.g. consumer grade VTR

Automatic detection of any supported colour standard

Luminance and chrominance signal processing for PAL BGDHIN, Combination-PAL N, PAL M, NTSC M, NTSC-Japan, NTSC 4.43 and SECAM

Adaptive 2/4-line comb filter for two dimensional chrominance/luminance-separation, also with VTR signals

- Increased Luminance and Chrominance Bandwidth for all PAL and NTSC-standards
- Reduced cross colour and cross luminance artefacts
- PAL delay line for correcting PAL phase errors

Brightness Contrast Saturation (BCS)- adjustment, separately for composite and baseband signals

User programmable sharpness control

Fast Blanking between component inputs and a CVBS input through a dedicated pin

Detection of copy-protected signals acc. to the Macrovision standard, indicating level of protection

Independent Gain and Offset - adjustment for raw data path

Component Video Processing

Synchronous Component Video (RGB) input via fast blanking, YCbCr input

Digital matrix

Video Scaler

Horizontal and Vertical Down-Scaling and Up-Scaling to randomly sized windows

Horizontal and Vertical Scaling range: variable zoom to 1/64 (icon)

(Note: H and V zoom are restricted by the transfer data rates)

Anti-Alias- and Accumulating Filter for Horizontal Scaling

Vertical Scaling with Linear Phase Interpolation and Accumulating Filter for Anti-Aliasing (6 bit phase accuracy)

Horizontal Phase Correct Up- and Down-Scaling for improved signal quality of scaled data, especially for compression and video phone applications, with 6 bit phase accuracy (1.2 nsec step width)

Two independent programming sets for scaler part, to define two "ranges" per field or sequences over frames

Fieldwise switching between Decoder-part and Expansion port (X-port) input

Brightness, contrast and saturation controls for scaled outputs

VBI-Data Decoder and Slicer

versatile VBI-data decoder, slicer, clock regeneration and byte synchronization

e.g. for WST, NABST, Close Caption, WSS, etc.

Audio Clock Generation

Generation of a field locked Audio Master Clock to support a constant number of audio clocks per video field

PAL/NTSC/SECAM Video Decoder with Adaptive Comb Filter, Component Video Input, VBI-Data Slicer and High Performance Scaler

SAA7118

Generation of an audio serial and left/right (channel) clock signal

Digital I/O Interfaces

Real Time signal port (R - port), incl. continuous line locked reference clock and real time status information supporting RTC level 3.1 (refer to external document "RTC Functional Specification" for details)

Bidirectional Expansion Port (X - port) with half duplex functionality (D1), 8-bit YCbCr

- output from Decoder part, real time and unscaled, or
- input to Scaler part, e.g. video from MPEG-decoder (extension to 16 bit possible)

Video Image port (I - port) configurable for 8 - bit data (extension to 16 bit possible) in Master Mode (own clock), or Slave Mode (external clock), with auxiliary timing and hand shake signals

Discontinuous data streams supported

32-word * 4 Byte FIFO register for video output data

28-word * 4 Byte FIFO register for decoded VBI output data

Scaled 4:2:2, 4:1:1, 4:2:0, 4:1:0 YCbCr output

Scaled 8-bit luminance only and raw CVBS data output sliced, decoded VBI data output

Miscellaneous

Power On Control

5 V tolerant digital inputs and I/O ports

Software controlled power saving stand-by modes supported

Programming via serial I²C-bus, full read-back ability by an external controller, bit rate up to 400 kbit/s

Boundary Scan Test circuit complies to the IEEE Std. 1149.b1 -1994

BGA156 package

2 APPLICATIONS

Multimedia

Digital Television

Image Processing

Video Phone

PC- Editing cards

PC- Tuner cards

3 GENERAL DESCRIPTION

Philips X-VIP is a new Multistandard Comb Filter Video Decoder chip with additional component processing, providing high quality, optionally scaled, video.

The SAA7118 is a combination of a four channel analog preprocessing circuit including source selection, anti-aliasing filter and A/D-converter, an automatic clamp and gain control, a Clock Generation Circuit (CGC), a Digital Multi Standard Decoder containing two-dimensional chrominance/luminance separation by an adaptive comb filter and a high performance scaler, including variable horizontal and vertical up and down scaling and a Brightness- Contrast- Saturation- Control circuit.

It is a highly integrated circuit for Desktop Video and similar applications. The decoder is based on the principle of line-locked clock decoding and is able to decode the colour of PAL, SECAM and NTSC signals into ITU-601 compatible colour component values. The SAA7118 accepts as analog inputs CVBS or S-Video (Y+C) from TV or VCR sources, including weak and distorted signals, as well as baseband component signals YCbCr or RGB. An expansion port (X-port) for digital video (bi-directional half duplex, D1 compatible) is also supported to connect to MPEG or video phone codec. At the so called image port (I-port) the 7118 supports 8 (16) bit wide output data with auxiliary reference data for interfacing to VGA controllers.

The target application for SAA7118 is to capture and optionally scale video images, to be provided as digital video stream through the image port of a VGA controller, for capture to system memory, or just to provide digital baseband video to any picture improvement processing.

SAA7118 also provides means for capturing the serially coded data in the vertical blanking interval (VBI-data). Two principal functions are available:

- to capture raw video samples, after interpolation to the required output data rate, via the scaler and
- a versatile data slicer (data recovery) unit.

SAA7118 incorporates also a field locked audio clock generation. This function ensures that there is always the same number of audio samples associated with a field, or a set of fields. This prevents the loss of synchronization between video and audio, during capture or playback.

All of the A/D- converters may be used to digitize a VSB signal for further for further decoding; a dedicated output port and a selectable VSB clock input is provided.

The circuit is controlled via I²C-bus (full write / read capability for all programming registers, bit rate up to 400 kbits/s)

PAL/NTSC/SECAM Video Decoder with Adaptive Comb Filter,
Component Video Input, VBI-Data Slicer and High Performance Scaler

SAA7118

4 QUICK REFERENCE DATA

SYMBOL	PARAMETER	MIN	TYP	MAX	UNIT
V_{DDx}	digital supply voltage	3.0	3.3	3.6	V
V_{DDCx}	digital core supply voltage	3.0	3.3	3.6	V
V_{DDA}	analog supply voltage	3.1	3.3	3.5	V
T_{amb}	ambient temperature	0	-	70	°C
P_{A+D}	analog and digital power dissipation ⁽¹⁾	-	t.b.d.	-	W

Note

- Power consumption is measured in CVBS-input mode (only one ADC active) and 8 bit image port output mode, expansion port is tristated

7 PINNING AND CONFIGURATION

7.1 Pinning List

Table 1 Pinning List SAA7118

PIN	NAME	TYPE	DESCRIPTION
A02	XTOUT	O	Crystal oscillator output signal
A03	XTAL	O	Connect output pin for quartz
A04	VXSS	P	Ground for crystal oscillator
A05	TDO	O	Test Data Output for Boundary Scan Test (2)
A06	XRDY	O	Status flag or ready signal from scaler
A07	XCLK	I/O	Clock I/O expansion port
A08	XPD0	I/O	LSB of expansion port bus
A09	XPD2	I/O	MSB-5 of expansion port bus
A10	XPD4	I/O	MSB-3 of expansion port bus
A11	XPD6	I/O	MSB-1 of expansion port bus
A12	TEST5	I/pu	Scan test input; do not connect
A13	TEST3	I/pu	Scan test input; do not connect
B01	AI41	I	Analog input #41
B02	RES1	O	Reserved pin for future extensions or testing, do not connect
B03	VXDD	P	Supply for crystal oscillator

PAL/NTSC/SECAM Video Decoder with Adaptive Comb Filter,
Component Video Input, VBI-Data Slicer and High Performance Scaler

SAA7118

PIN	NAME	TYPE	DESCRIPTION
B04	XTALI	I	Connect input pin for quartz
B05	TDI	I/pu	Test Data Input for Boundary Scan Test (with internal pull-up) (2)
B06	TCK	I/pu	Test Clock for Boundary Scan Test (with internal pull-up) (2)
B07	XDQ	I/O	Data qualifier for expansion port
B08	XPD1	I/O	MSB-6 of expansion port bus
B09	XPD3	I/O	MSB-4 of expansion port bus
B10	XPD5	I/O	MSB-2 of expansion port bus
B11	XTRI	I	X-port output control signal; effects (XPD[7:0], XRH, XRV, XDQ and XCLK)
B12	TEST4	O	Scan test output; do not connect
B13	RES2	NC	Reserved pin for future extensions or testing, do not connect
B14	RES3	NC	Reserved pin for future extensions or testing, do not connect
C01	VSSA4	P	Ground for analog input AI4x
C02	AGND	P	Analog Signal Ground
C03	RES4	NC	Reserved pin for future extensions or testing, do not connect
C04	RES5	NC	Reserved pin for future extensions or testing, do not connect
C05	VDDE1	P	Digital supply peripheral cells
C06	TRSTN	I/pu	Test ReSeT Not for Boundary Scan Test (with internal pull-up) (1)
C07	XRH	I/O	Horizontal reference expansion-port
C08	VDDI1	P	Digital supply core
C09	VDDE2	P	Digital supply peripheral cells
C10	VDDI2	P	Digital supply core
C11	XPD7	I/O	MSB of expansion port bus
C12	RES6	NC	Reserved pin for future extensions or testing, do not connect
C13	RES7	NC	Reserved pin for future extensions or testing, do not connect
C14	TEST2	I/pu	Scan test input; do not connect
D01	AI43	I	Analog input #43
D02	AI42	I	Analog input #42
D03	AI4D	I/O	Differential input for AI4x
D04	VDDA4	P	Supply for analog input AI4x
D05	VSSE1	P	Digital ground peripheral cells
D06	TMS	I/pu	Test Mode Select for Boundary Scan Test or Scan Test (with internal pull-up) (2)
D07	VSSI1	P	Digital ground core (Substrate connection)
D08	XRV	I/O	Vertical reference for expansion-port
D09	VSSE2	P	Digital ground peripheral cells
D10	VSSI2	P	Digital ground core
D11	VSSE3	P	Digital ground peripheral cells
D12	VDDE3	P	Digital supply peripheral cells
D13	TEST1	I/pu	Scan test input; do not connect
D14	HPD0	I/O	LSB of H-port bus, extended CbCr input for X-port, extended CbCr output for I-port
E01	AI44	I	Analog input #44

PAL/NTSC/SECAM Video Decoder with Adaptive Comb Filter,
Component Video Input, VBI-Data Slicer and High Performance Scaler

SAA7118

PIN	NAME	TYPE	DESCRIPTION
E02	VDDA4A	P	Supply for analog input AI4x
E03	AI31	I	Analog input #31
E04	VSSA3	P	Ground for analog input AI3x
E11	HPD1	I/O	MSB-6 of H-port bus, extended CbCr input for X-port, extended CbCr output for I-port
E12	HPD3	I/O	MSB-4 of H-port bus, extended CbCr input for X-port, extended CbCr output for I-port
E13	HPD2	I/O	MSB-5 of H-port bus, extended CbCr input for X-port, extended CbCr output for I-port
E14	HPD4	I/O	MSB-3 of H-port bus, extended CbCr input for X-port, extended CbCr output for I-port
F01	AI3D	I/O	Differential input for AI3x
F02	AI32	I	Analog input #32
F03	AI33	I	Analog input #33
F04	VDDA3	P	Supply for analog input AI3x
F11	VSSI3	P	Digital ground core
F12	VDDI3	P	Digital supply core
F13	HPD5	I/O	MSB-2 of H-port bus, extended CbCr input for X-port, extended CbCr output for I-port
F14	HPD6	I/O	MSB-1 of H-port bus, extended CbCr input for X-port, extended CbCr output for I-port
G01	AI34	I	Analog input #34
G02	VDDA3A	P	Supply for analog input AI3x
G03	AI22	I	Analog input #22
G04	AI21	I	Analog input #21
G11	VSSE4	P	Digital ground peripheral cells
G12	IPD1	O	MSB-6 of Image port bus
G13	HPD7	I/O	MSB of H-port bus, extended CbCr input for X-port, extended CbCr output for I-port
G14	IPD0	O	LSB of Image port bus
H01	AI2D	I/O	Differential input for AI2x
H02	AI23	I	Analog input #23

SAA7118

PIN	NAME	TYPE	DESCRIPTION
J11	VSSI4	P	Digital ground core
J12	VDDI4	P	Digital supply core
J13	IPD6	O	MSB-1 of Image port bus
J14	IPD5	O	MSB-2 of Image port bus
K01	AI12	I	Analog input #12
K02	AI13	I	Analog input #13
K03	AI1D	I/O	Differential input for AI1x
K04	VDDA1	P	Supply for analog input AI1x
K11	IPD7	O	MSB of Image port bus
K12	IGPH	O	Multi purpose horizontal reference signal
K13	IGP1	O	General purpose signal #1
K14	IGPV	O	Multi purpose vertical reference signal
L01	VDDA1A	P	Supply for analog input AI1x
L02	AGNDA	P	Analog signal ground connection
L03	AI14	I	Analog input #14
L04	VSSE5	P	Digital ground peripheral cells
L05	VSSI5	P	Digital ground core
L06	ADP6	O	MSB-2 of Direct A/D-converted output bus (VSB)
L07	ADP3	O	MSB-5 of Direct A/D-converted output bus (VSB)
L08	VSSE6	P	Digital ground peripheral cells
L09	VSSI6	P	Digital ground core
L10	RTCO	O/st/pd (3)	RTC output; strap to LOW (4k7) for first I ² C slave address 42h strap to HIGH (4k7) for second I ² C slave address 40h
L11	VSSE7	P	Digital ground peripheral cells
L12	ITRI	I/O	Image-port control signal, effects all Image port pins
L13	IDQ	O	Data qualifier for image port
L14	IGP0	O	General purpose signal #0
M01	AOUT	O	Analog test output (not for use in application)
M02	VSSA0	P	Ground for internal clock generator
M03	VDDA0	P	Supply for internal clock generator
M04	VDDE5	P	Digital supply peripheral cells
M05	VDDI5	P	Digital supply core
M06	ADP7	O	MSB-1 of Direct A/D-converted output bus (VSB)
M07	ADP2	O	MSB-6 of Direct A/D-converted output bus (VSB)
M08	VDDE6	P	Digital supply peripheral cells
M09	VDDI6	P	Digital supply core
M10	RTS0	O	Real time status or sync information
M11	VDDE7	P	Digital supply peripheral cells
M12	AMXCLK	I	Audio Master External clock input

PAL/NTSC/SECAM Video Decoder with Adaptive Comb Filter,
Component Video Input, VBI-Data Slicer and High Performance Scaler

SAA7118

PIN	NAME	TYPE	DESCRIPTION
M13	FSW	I/pd	Fast Switch (Blanking), with internal pull-down, inserts component inputs into CVBS signal
M14	ICLK	I/O	Clock output signal for image-port, LCLK of LPB image port mode, or optional asynchronous backend clock input
N01	RES8	NC	Reserved pin for future extensions or testing, do not connect
N02	RES9	I/pu	Reserved pin for future extensions or testing, do not connect
N03	RES10	I/pd	Reserved pin for future extensions or testing, do not connect
N04	CE	I/pu	Chip Enable or Reset with internal pull-up
N05	LLC2	O	Line-locked clock at half frequency (13.5 MHz nominal)
N06	CLKEXT	I	External clock input intended for A/D-conversion of VSB signals (36 MHz)
N07	ADP5	O	MSB-3 of Direct A/D-converted output bus (VSB)
N08	ADP0	O	LSB of Direct A/D-converted output bus (VSB)
N09	SCL	I	I ² C Serial Clock
N10	RTS1	O	Real time status or sync information
N11	ASCLK	O	Audio serial clock
N12	ITRDY	I	Target Ready for image port bus
N13	RES11	NC	Reserved pin for future extensions or testing, do not connect
N14	RES12	NC	Reserved pin for future extensions or testing, do not connect
P02	RES13	I/O	Reserved pin for future extensions or testing, do not connect
P03	EXMCLR	I/pd	External Mode Clear, with internal pull-down
P04	LLC	O	Line-locked clock (27 MHz nominal)
P05	RESON	O	Reset Output Not signal
P06	ADP8	O	MSB of Direct A/D-converted output bus (VSB)
P07	ADP4	O	MSB-4 of Direct A/D-converted output bus (VSB)
P08	ADP1	O	MSB-7 of Direct A/D-converted output bus (VSB)
P09	INT_A	O/od	I ² C interrupt flag (Low if any enabled status bit has changed)
P10	SDA	I/O/od	I ² C Serial Data
P11	AMCLK	O	Audio Master clock, must be less than half the crystal clock frequency
P12	ALRCLK	O/st/pd	Audio left/right clock, strap to LOW (4k7) for 24.576 MHz crystal strap to HIGH (4k7) for 32.11 MHz crystal (3)
P13	TEST0	I/pu	Scan test input; do not connect
TYPE description: I=input, O=output, P=power, NC=not connected, st=strapping, pu=pull-up, pd=pull-down, od=open drain			

Notes

1. This pin provides easy initialization of BST circuitry. TRSTN can be used to force the TAP (Test Access Port) controller to the Test-Logic-Reset state (normal operation) at once
2. According to the IEEE1149.1-1994 standard the pads TDI and TMS are input pads with a internal pull-up transistor and TDO a tri-state output pad. TCK, TRSTN are also built with internal pile-up
3. Strapping remark: If the strapping pin is unused, the internal pull-down resistor is sufficient for strap function. If pin is used in an application, an external strapping resistor (4,7k) is necessary to get a certain strap function.

FLI2200

Description

The FLI2200 is a single chip implementation of Faroudja Laboratories' award winning deinterlacing and post-processing algorithms that produce the highest quality progressive video output from a variety of interlaced video inputs including 525/60 (NTSC) or 625/50 (PAL or SECAM). It uses patented and patent pending motion-adaptive deinterlacing that selects the optimal filtering on a per-pixel basis. This includes detection and proper interleaving of 3:2 and 2:2 pulldown for film-base sources, including continuous monitoring and compensation for bad edits that occur frequently in broadcast material due to poor scene cuts or insertion of commercials. Video material is processed by a set of content-sensitive spatio-temporal filters that adapt to the appropriate direction for smoothest interpolation using the patented Faroudja DCDi™ algorithm. The FLI2200 also includes motion-adaptive cross-color suppression that removes highly objectionable coloration artifacts produced by commonly used video decoders. Its internal processing uses 10 bits per channel to maintain the highest quality. Its inputs and outputs are 10 bits/channel for best quality but also supports 8 bits/channel for more cost-sensitive applications. The FLI2200 requires 4 MB of low cost SDRAM for best quality deinterlacing, but it can also be operated in an optimized intra-field mode without memory for more cost-sensitive applications. This makes possible the use of a single design for both high-end and low-end applications.

The FLI2200 integrates a number of functions to provide maximum flexibility in a low cost configuration. This includes an on-chip clock generator, SDRAM controller, display controller, input and output color-space converters. It uses a standard 2-wire serial control interface for easy control and access to the registers.

The FLI2200 can be connected without glue logic to the FLI2000 video decoder and FLI2220 Enhancer and OSD Generator to produce the highest quality video pipeline for premium applications. It is also fully compatible with other decoders having a ITU-R BT 656 output format.

Applications

Flat panel TV – LCD, PDP
Progressive scan TVs
Multimedia front/rear projectors
Home Theater
Scan Converters
Multimedia PCs/Workstations

DCDi™ is a Faroudja trademark

Features

Motion-adaptive cross-color suppression removes artifacts produced by improper Y/C separation in low-cost video decoders

Motion-adaptive video deinterlacing selects optimal filtering on a per-pixel basis

Film-mode for proper handling of 3:2 and 2:2 pulldown material

Bad-edit detection/correction compensates for poor scene cuts and insertions common in broadcast material

Motion-weighted interpolation for video sources produces maximum resolution without introducing motion artifacts

Directional Correlational Deinterlacing (DCDi™) minimizes jaggies on angled lines

8/10-bit Y/Cb/Cr (D1) (ITU-R BT 656), 16/20-bit Y Cb/Cr (ITU-R BT 601), 24/30-bit RGB or YCbCr/YPbPr interlaced input options

? Supports 525/60 (NTSC), 625/50 (PAL/SECAM)

? Accepts up to 1100 pixels/line

8/10-bit, 16/20-bit YUV, 24/30-bit RGB or YCbCr/YPbPr progressive output options

Supports 8- or 10-bit inputs and outputs

10-bit internal processing for highest quality

Includes color-space converters at input and output for maximum flexibility

Auto-detection of NTSC/PAL/SECAM inputs

High-order filtering produces smooth chroma output in 4:2:2 to 4:4:4 or 4:4:4 to 4:2:2 conversions

Resolution recovery maximizes output signal-to-noise ratio and dynamic range

Can be operated without glue logic with FLI2000 Video Decoder and FLI2220 Enhancer and OSD Generator ICs to produce highest quality video pipeline

Glue-less interface to most standard video decoders

Built-in display timing generator

On-chip clock generator eliminates external PLLs

On-chip SDRAM controller

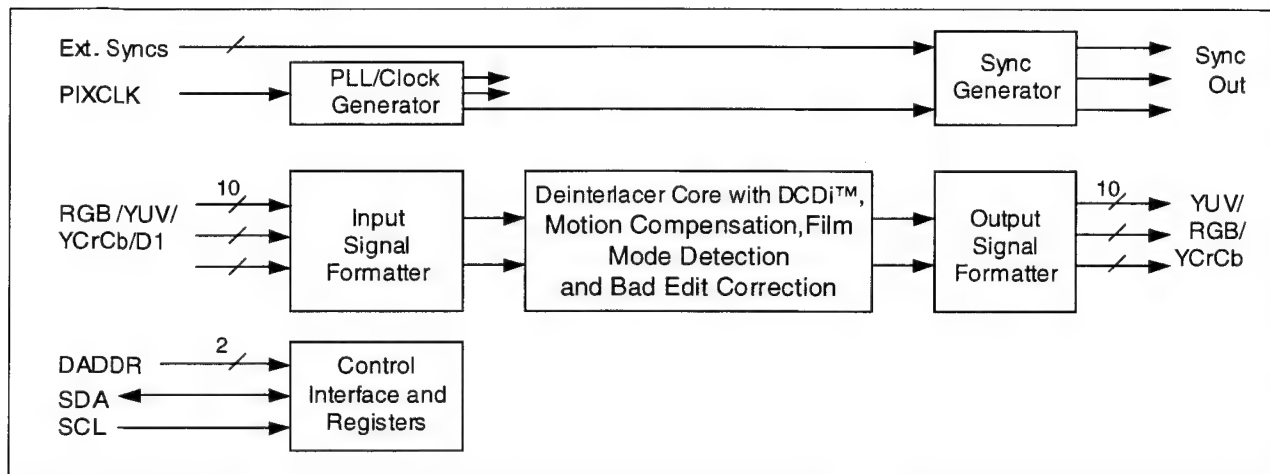

Uses low cost SDRAM as field memory – 4 MB

Optimized intra-field operation allows memory-less configuration for lowest cost applications with same design and layout as for high-end applications

2-wire serial control interface for easy control

176-pin TQFP package

Simplified Block Diagram

Pin description

Pin Connections and Functions

Pin #	Name	Description
See list	V _{SS}	Ground connections. Connect to the digital ground plane. Pins: 2, 17, 34, 55, 64, 74, 85, 96, 106, 115, 124, 132, 138, 145, 152, 159, 168
See list	V _{DD33}	Pad Ring digital power connections. Connect to the digital 3.3 volt power supply and decouple to the digital ground plane. Pins: 1, 33, 63, 73, 84, 95, 105, 114, 123, 137, 144, 151, 167
See list	V _{DD25}	Core Logic digital power connections. Connect to the digital 2.5 volt power supply and decouple to the digital ground plane. Pins: 16, 54, 107, 158
43	AV _{SS}	Ground connection for the clock PLL circuits. Connect to the digital ground plane
42	AV _{DD}	Analog power connections for the clock PLL circuit. Connect to a separately decoupled 2.5 volt power supply and decouple directly to the AV _{SS} pin..
49	RESETB	Reset. When this input is set low it will reset all the internal registers to the default states. Refer to the section on the control registers for details of these states. The device must be reset after it is powered-up.
53	OE	When this pin is set high the outputs of the FLI2200 will be enabled; when it is set low the outputs will be set into a high-impedance state.
56-58	IFORMAT ₂₋₀	Input signal format control. The settings of these pins set the format of the input signal. This can be overridden by the IFmtOvr bit, bit 3 in register 00 _H , allowing this function to be set or changed via the I ² C bus. Please refer to the description of register 00 _H for details.
59-61	OFORMAT ₂₋₀	Output signal format control. The settings of these pins set the format of the output signal. This can be overridden by the OFmtOvr bit, bit 3 in register 07 _H , allowing this function to be set or changed via the I ² C bus. Please refer to the description of register 07 _H for details.
44-45	DADDR ₁₋₀	The settings of DADDR ₁₋₀ allow the device address of the control bus to be programmed to prevent conflict with the other devices connected to the bus. DADDR ₁₋₀ allow the device address to be set to any of the following values: C0/C1 _H , C2/C3 _H , E0/E1 _H , E2/E3 _H . Please refer to the section "Control Bus Operation and Protocol" for further information.
46	MODE	When this pin is set low the control bus will operate in the slave mode; allowing the device to be programmed from an external controller. When it is set high the FLI2200 will self-program from an external I ² C memory connected to the bus. Please refer to the "Control Bus Operation and Control Protocol" section for more details.
47	SDA	2-wire serial control bus data. Data can be written to the control registers via this pin when it is in the input mode and data can be read from the status registers when it is in the output mode. Refer to the section on the serial port for timing and format details and to the section on the registers for programming information.
48	SCL	2-wire serial control bus clock. When the control port operates in slave mode this pin will be an input and when it operates in the self programming mode it will be an output.
40	PIXCLK	Pixel clock input. This clock is used to drive all the circuits in the FLI2200. An internal PLL is used to upconvert this clock to provide the master clock signal and other clocks used internally. Note that when the FLI2200 is used in the D1 input mode the PIXCLK input should run at the rate of two cycles per pixel (one for luma and one for chroma).
62	N/P/IN/OUT	NTSC/PAL input or output. The default function of this pin is NTSC/PAL signal indicator output. When the input video signal is a 525 line signal this pin will be set high and when it is a 625 line signal the pin is set low. This function of this pin can be programmed to be an input according to the setting of this pin if the NPOp ₁₋₀ bits, bits 5-4 in register 03 _H , are set to 00 _H , overriding the internal line counter. i.e., it will treat the signal as a 525 line signal when it is set high and a 625 line signal when it is set low.

Pin #	Name	Description
52	NOMEM	No Memory Mode control input. This pin controls the operation of the FLI2200 as follows: When this pin is set low the device is used with external field memories and operates in the full set of deinterlacing modes, i.e., motion adaptive video deinterlacing and full frame film source deinterlacing using 3:2 pulldown detection (2:2 pulldown for 625/50 sources). When this pin is set high the FLI2200 is forced into the intra-field only deinterlacing mode, which requires no external memories, allowing the FLI2200 to be used in low-cost applications where the ultimate video quality is not a requirement. To ensure proper startup of the SDRAMs this pin should be set high during the power-up sequence. This can be overridden by the NMOvr bit, bit 1 in register 05 _H , allowing this function to be set or changed via the I ² C bus. Please refer to the description of register 05 _H for details.
27-18	G/YIN _{9,0}	10-bit green or luminance signal input bus. The mode is set by the IFORMAT _{2,0} pins. This can be overridden by the IFmtOvr bit, bit 3 in register 00 _H , allowing this function to be set or changed via the I ² C bus. Please refer to the description of register 00 _H for details. This signal is sampled on the rising edge of PIXCLK.
15-6	B/CbIN _{9,0}	10-bit blue or Cb chroma signal input bus. The mode is set by the IFORMAT _{2,0} pins. This can be overridden by the IFmtOvr bit, bit 3 in register 00 _H , allowing this function to be set or changed via the I ² C bus. Please refer to the description of register 00 _H for details. Bits 6, 4 and 3 in register 08 _H specify the busses used in the multiplexed modes. In all cases the signals are sampled on the rising edges of PIXCLK. In the Y Cb Cr and Y Pb Pr modes the Cb or Pb signal is sampled on alternate rising edges of PIXCLK in 4:2:2 mode. The frequency of PIXCLK will be 27 MHz in the multiplexed Y/Cb/Cr mode and 13.5 MHz in all other modes. These pins should be tied low when not used.
39-35 32-28	R/CrIN _{9,0}	10-bit red or Cr chroma signal input bus. The mode is set by the IFORMAT _{2,0} pins. This can be overridden by the IFmtOvr bit, bit 3 in register 00 _H , allowing this function to be set or changed via the I ² C bus. Please refer to the description of register 00 _H for details. Bits 6, 4 and 3 in register 08 _H specify the busses used in the multiplexed modes. In all cases the signals are sampled on the rising edges of PIXCLK. In the Y Cb Cr mode the Cr signal is sampled on alternate rising edges of PIXCLK in 4:2:2 mode. The frequency of PIXCLK will be 27 MHz in the multiplexed Y/Cb/Cr mode and 13.5 MHz in all other modes. These pins should be tied low when not used.
3	HSYNCREFI	Horizontal sync or reference. The horizontal sync or reference of the input signal should be connected to this pin. The function is programmed with bit 4 in register 00 _H . The polarity and position of the sync or reference pulse relative to the start of active video are both programmable within a small range. When the FLI2200 is used in the ITU-R BT 601/D1 input mode with embedded syncs (IFormat = 110) this input is not used and should be tied low; in this case all sync information will be derived from the signal.
4	VSYNCREFI	Vertical sync or reference. The vertical sync or reference of the input signal should be connected to this pin. The function is programmed with bit 4 in register 00 _H . The polarity and position of the sync or reference pulse relative to the start of active video are both programmable within a small range. When the FLI2200 is used in the ITU-R BT 601/D1 input mode with embedded syncs (IFormat = 110) this input is not used and should be tied low; in this case all sync information will be derived from the signal.
5	FLDIN	Field identifier input. The field identifier output of the source signal should be connected to this pin. A low setting signifies an even field and a high level signifies an odd field. When bit 4 in register 00 _H is set low, the input timing is based on HREF and VREF and this signal is required. When this bit is set high the input timing is based on HSYNC and VSYNC and this signal is generated internally and is not required. When bit 5 in register 06 is set high this signal is also used as the frame boundary identifier for 30 Hz film sources.

Pin #	Name	Description
65-72 75-76	G/YOUT _{9,0}	Green or luminance output bus. In the RGB mode this output is the Green signal and in the YCbCr mode it is the Y signal. The mode is set by the OFORMAT _{2,0} pins. This can be overridden by the OFmtOvr bit, bit 3 in register 07 _H , allowing this function to be set or changed via the I ² C bus. Please refer to the description of register 07 _H for details. The signal is clocked out on the falling edge of YCLKO.
93-94 97-104	B/CbOUT _{9,0}	Blue or Cb chrominance output bus. In the RGB mode this output is the Blue signal, in the YCbCr mode it is the Cb signal. The mode is set by the OFORMAT _{2,0} pins. This can be overridden by the OFmtOvr bit, bit 3 in register 07 _H , allowing this function to be set or changed via the I ² C bus. Please refer to the description of register 07 _H for details. The busses used in the multiplexed modes are set by means of bit 5 in register 08 _H . The signal is clocked out on the falling edge of YCLKO in the RGB and YUV 4:4:4 modes, on the falling edge of YCLKO prior to the next rising edge of CCLKO in the YUV 4:2:2 mode, and on the rising edge of MEMCLKO in the multiplexed YCbCr (pseudo D1) mode.
77-83 86-88	R/CrOUT _{9,0}	Red or Cr chrominance output bus. In the RGB mode this output is the Red signal, in the YCbCr mode it is the Cr signal. The mode is set by the OFORMAT _{2,0} pins. This can be overridden by the OFmtOvr bit, bit 3 in register 07 _H , allowing this function to be set or changed via the I ² C bus. Please refer to the description of register 07 _H for details. The busses used in the multiplexed modes are set by means of bit 5 in register 08 _H . The signal is clocked out on the falling edge of YCLKO in the RGB and YUV 4:4:4 modes, on the falling edge of YCLKO prior to the next rising edge of CCLKO in the YUV 4:2:2 mode, and on the rising edge of MEMCLKO in the multiplexed YCbCr (pseudo D1) mode.
116	CCLKO	Chroma output sampling clock. This clock is derived from PIXCLK and will be at half the frequency of YCLKO. In 30-bit 4:2:2 output mode the chroma output signals will change on the falling edge of YCLKO prior to the next rising edge this clock.
117	YCLKO	Luma output sampling clock. This clock is derived from PIXCLK and is double the frequency of PIXCLK. In 30-bit and 20-bit output modes the output signals will change on the falling edge of this clock.
89	VREFO	Start of active field or frame indicator. This signal goes high to indicate the first active line in each field or frame and goes low during the vertical blanking interval. The polarity and timing of this signal are programmable.
90	HREFO	Start of active line indicator output. This signal goes high to indicate the first active pixel in each line and goes low during the horizontal blanking interval. The polarity and timing of this signal are programmable.
91	VSYNC/ CREFO	Vertical sync output. This signal provides the vertical sync function for the outputs. Its polarity is programmable to be active high or active low. It can also be programmed to be a composite reference for applications requiring this instead of sync.
92	H/CSYNCO	Horizontal or composite sync output. This signal provides the horizontal sync function for the outputs. Its polarity is programmable to be active high or active low. This signal can also be programmed to be the composite sync output, CSYNC.
108	FSYNC	Film mode sync output. When film mode is detected this pin will toggle in sync with the 3:2 (NTSC) or 2:2 (PAL and 30 Hz film in NTSC) pulldown sequence detected in the source.
110	FILM	Film mode detector output. This pin will be set high when the FLI2200 detects that the video input was converted from 24 fps film with a teleciné machine. If film mode is not detected this pin will be set low.

Pin #	Name	Description
125-131 133-136	ADDR ₁₀₋₀	SDRAM Address bus. This signal bus is used to address the external SDRAM(s) used for field memories. It should be connected to the A ₁₀₋₀ bus of the memory chip(s). Please refer to the Applications section of this data sheet for further details.
176-169 166-160 157-153 150-146 143-139	DATA ₂₉₋₀	SDRAM Data bus. This signal bus is used to transfer the data to and from the external SDRAM(s) used for field memories. It should be connected to the DQ ₂₉₋₀ bus of the memory chip when using a 64 Mbit SDRAM. When using two 16 Mbit SDRAMs this 30-bit bus may be connected to the two 16-bit data busses of the memories in two ways: either connect 16 lines to one chip and 14 to the other, or connect 15 to both. In all cases the two unused data lines on the memory chip(s) should be connected to ground via 22 k Ω resistors. Please refer to the Applications section of this data sheet for further details.
118	MEMCLKO	SDRAM clock and 2x output sampling clock. This clock is derived from PIXCLK and will be at double the frequency of YCLKO. This active signal should be connected to the CLK pin(s) on the SDRAM(s). When the 10-bit output mode selected the output signals will also change at this clock rate and this should then be used as the output clock..
119	WEN	SDRAM Write Enable. This active low signal should be connected to the WE pin(s) on the SDRAM(s).
120	RASN	SDRAM Row Address Select. This active low signal should be connected to the RAS pin(s) on the SDRAM(s).
121	CASN	SDRAM Column Address Select. This active low signal should be connected to the CAS pin(s) on the SDRAM(s).
122	BSEL	SDRAM Bank Select. When using two 16 Mbit SDRAMs this signal should be connected to the BA (also called BS or A ₁₁) pin on both SDRAMs. When using a 64 Mbit SDRAM this signal should be connected to the BA0 (also called BS0 or A ₁₁) pin on the SDRAM and BA1/BS1 (also called BA when BA0 is referred to as A ₁₁) should be tied low.
41, 50, 51, 109, 111	TEST ₄₋₀	These pins are used for test purposes only and should always be tied low for normal operation.
112, 113	TESTO ₁₋₀	These pins are test outputs and should be left unconnected in normal operation.

SYNCHRONOUS DRAM

MT48LC2M32B2 - 512K x 32 x 4 banks

 For the latest data sheet, please refer to the Micron Web site: www.micronsemi.com/datasheets/sdramds.html

FEATURES

- PC100 functionality
- Fully synchronous; all signals registered on positive edge of system clock
- Internal pipelined operation; column address can be changed every clock cycle
- Internal banks for hiding row access/precharge
- Programmable burst lengths: 1, 2, 4, 8, or full page
- Auto Precharge, includes CONCURRENT AUTO PRECHARGE, and Auto Refresh Modes
- Self Refresh Mode
- 64ms, 4,096-cycle refresh (15.6µs/row)
- LVTTTL-compatible inputs and outputs
- Single +3.3V±0.3V power supply
- Supports CAS latency of 1, 2, and 3.

OPTIONS

- Configuration
2 Meg x 32 (512K x 32 x 4 banks)
- Plastic Package - OCPL¹
86-pin TSOP (400 mil)
- Timing (Cycle Time)
 - 5ns (200 MHz)
 - 5.5ns (183 MHz)
 - 6ns (166 MHz)
 - 7ns (143 MHz)
- Operating Temperature Range
Commercial (0° to +70°C)
Extended (-40°C to +85°C)

MARKING

PART NUMBER	ARCHITECTURE
MT48LC2M32B2TG	2 Meg x 32

GENERAL DESCRIPTION

The 64Mb SDRAM is a high-speed CMOS, dynamic random-access memory containing 67,108,864-bits. It is internally configured as a quad-bank DRAM with a synchronous interface (all signals are registered on the positive edge of the clock signal, CLK). Each of the 16,777,216-bit banks is organized as 2,048 rows by 256 columns by 32 bits.

Read and write accesses to the SDRAM are burst oriented; accesses start at a selected location and continue for a programmed number of locations in a programmed sequence. Accesses begin with the registration of an ACTIVE command, which is then followed by a READ or WRITE command. The address bits registered coincident with the ACTIVE command are used to select the bank and row to be accessed (BA0, BA1 select the bank, A0-A10 select the row). The address bits registered coincident with the READ or WRITE command are used to select the starting column location for the burst access.

The SDRAM provides for programmable READ or WRITE burst lengths of 1, 2, 4, or 8 locations, or the full page, with a burst terminate option. An auto precharge function may be enabled to provide a self-timed row precharge that is initiated at the end of the burst sequence.

The 64Mb SDRAM uses an internal pipelined architecture to achieve high-speed operation. This architecture is compatible with the 2n rule of prefetch architectures, but it also allows the column address to be changed on every clock cycle to achieve a high-speed, fully random access. Precharging one bank while accessing one of the other three banks will hide the precharge cycles and provide seamless, high-speed, random-access operation.

The 64Mb SDRAM is designed to operate in 3.3V, low-power memory systems. An auto refresh mode is provided, along with a power-saving, power-down mode. All inputs and outputs are LVTTTL-compatible.

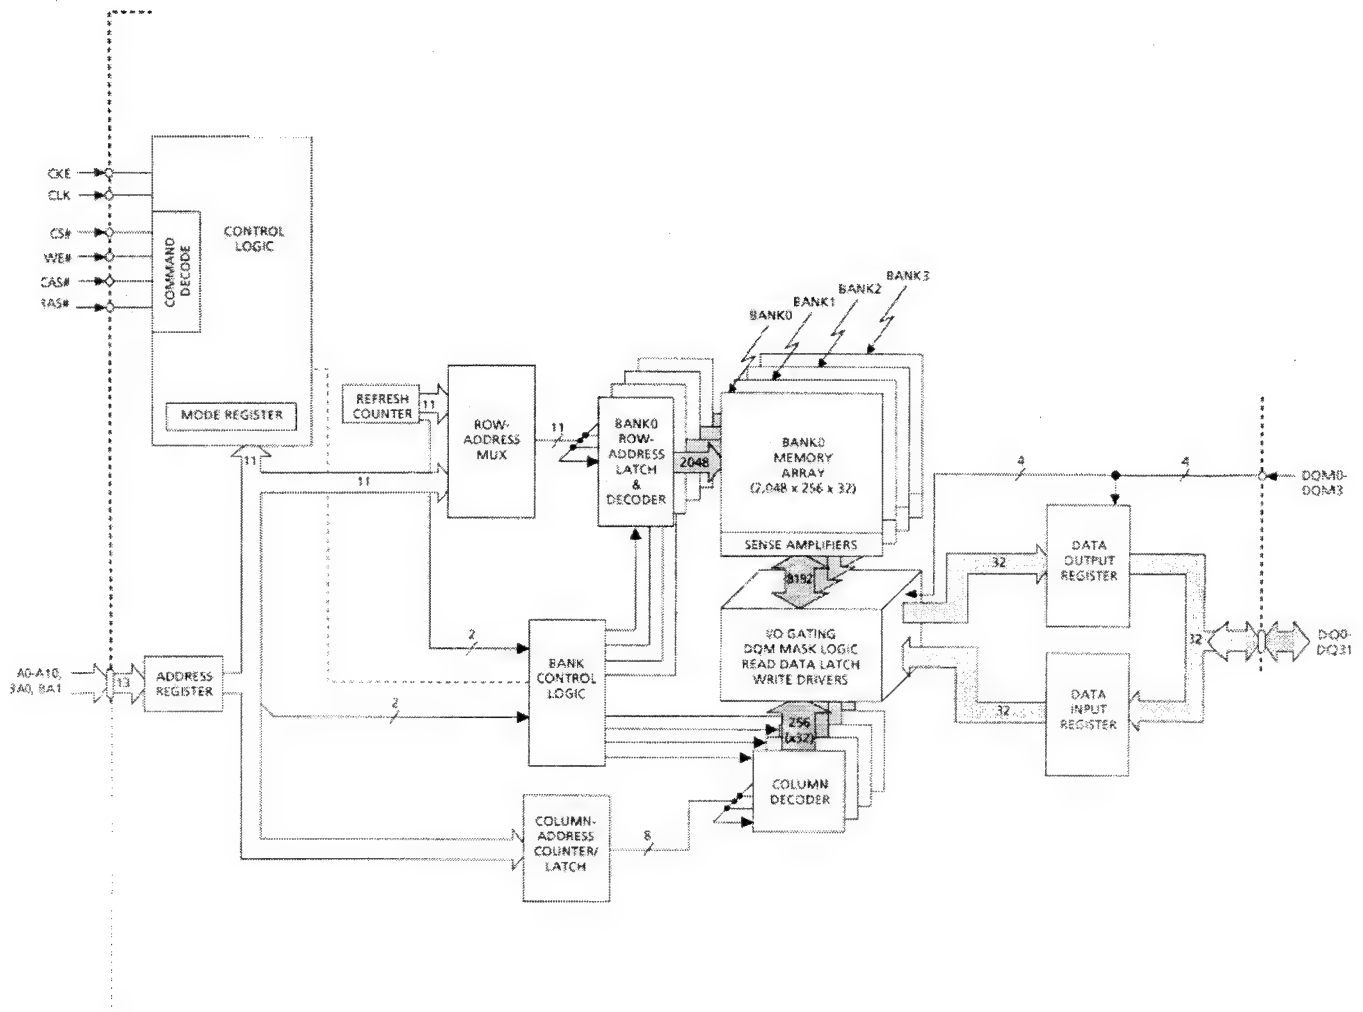

SDRAMs offer substantial advances in DRAM operating performance, including the ability to synchronously burst data at a high data rate with automatic column-address generation, the ability to interleave between internal banks to hide precharge time and the capability to randomly change column addresses on each clock cycle during a burst access.

PIN DESCRIPTIONS

PIN NUMBERS	SYMBOL	TYPE	DESCRIPTION
68	CLK	Input	Clock: CLK is driven by the system clock. All SDRAM input signals are sampled on the positive edge of CLK. CLK also increments the internal burst counter and controls the output registers.
67	CKE	Input	Clock Enable: CKE activates (HIGH) and deactivates (LOW) the CLK signal. Deactivating the clock provides PRECHARGE POWER-DOWN and SELF REFRESH operation (all banks idle), ACTIVE POWER-DOWN (row active in any bank) or CLOCK SUSPEND operation (burst/access in progress). CKE is synchronous except after the device enters power-down and self refresh modes, where CKE becomes asynchronous until after exiting the same mode. The input buffers, including CLK, are disabled during power-down and self refresh modes, providing low standby power. CKE may be tied HIGH.
20	CS#	Input	Chip Select: CS# enables (registered LOW) and disables (registered HIGH) the command decoder. All commands are masked when CS# is registered HIGH. CS# provides for external bank selection on systems with multiple banks. CS# is considered part of the command code.
17, 18, 19	WE#, CAS#, RAS#	Input	Command Inputs: WE#, CAS#, and RAS# (along with CS#) define the command being entered.
16, 71, 28, 59	DQM0-DQM3	Input	Input/Output Mask: DQM is sampled HIGH and is an input mask signal for write accesses and an output enable signal for read accesses. Input data is masked during a WRITE cycle. The output buffers are placed in a High-Z state (two-clock latency) during a READ cycle. DQM0 corresponds to DQ0-DQ7; DQM1 corresponds to DQ8-DQ15; DQM2 corresponds to DQ16-DQ23; and DQM3 corresponds to DQ24-DQ31. DQM0-DQM3 are considered same state when referenced as DQM.
22, 23	BA0, BA1	Input	Bank Address Input(s): BA0 and BA1 define to which bank the ACTIVE, READ, WRITE or PRECHARGE command is being applied.
25-27, 60-66, 24	A0-A10	Input	Address Inputs: A0-A10 are sampled during the ACTIVE command (row-address A0-A10) and READ/WRITE command (column-address A0-A7 with A10 defining auto precharge) to select one location out of the memory array in the respective bank. A10 is sampled during a PRECHARGE command to determine if all banks are to be precharged (A10 HIGH) or bank selected by BA0, BA1 (LOW). The address inputs also provide the op-code during a LOAD MODE REGISTER command.
2, 4, 5, 7, 8, 10, 11, 13, 74, 76, 77, 79, 80, 82, 83, 85, 31, 33, 34, 36, 37, 39, 40, 42, 45, 47, 48, 50, 51, 53, 54, 56	DQ0-DQ31	Input/Output	Data I/Os: Data bus.
14, 21, 30, 57, 69, 70, 73	NC	-	No Connect: These pins should be left unconnected. Pin 70 is reserved for SSTL reference voltage supply.
3, 9, 35, 41, 49, 55, 75, 81	V _{DDQ}	Supply	DQ Power Supply: Isolated on the die for improved noise immunity.
6, 12, 32, 38, 46, 52, 78, 84	V _{SSQ}	Supply	DQ Ground: Provide isolated ground to DQs for improved noise immunity.
1, 15, 29, 43	V _{DD}	Supply	Power Supply: +3.3V ±0.3V.
44, 58, 72, 86	V _{SS}	Supply	Ground.

9.8.10 ADV7196

ADV7196A

INPUT FORMATS

YCrCb in 2x10-Bit (4:2:2) or 3x10-Bit (4:4:4) format compliant to SMPTE-293M (525p), ITU-R.BT1358 (625p), SMPTE274M (1080i), SMPTE296M (720p) and any other High Definition standard using Async Timing Mode
RGB in 3x10 Bit 4:4:4 format

OUTPUT FORMATS

YPrPb Progressive Scan (EIA-770.1, EIA-770.2)
YPrPb HDTV (EIA 770.3)
RGB levels compliant to RS-170 and RS-343A
11-Bit + Sync (DAC A)
11-Bit DACs (DAC B, DAC C)

PROGRAMMABLE FEATURES

Internal Testpattern Generator with Color Control
Y/C delay (+/-)
Gamma Correction
Individual DAC on/off control
54MHz Output (2xOversampling)
Sharpness filter with programmable gain/attenuation

GENERAL DESCRIPTION

The ADV7196A is a triple high speed, digital-to-analog encoder on a single monolithic chip. It includes of three high speed video D/A converters with TTL compatible inputs.

The ADV7196A has three separate 10-Bit wide input ports which accept data in 4:4:4 10-Bit YCrCb or RGB or 4:2:2 10-Bit YCrCb. This data is accepted in progressive scan format at 27MHz or HDTV format at 74.25MHZ or 74.1758MHz. For any other High Definition standard but SMPTE 293M, ITU-R BT.1358, SMPTE274M or SMPTE296M the Async Timing Mode can be used to input data to the ADV7196A. For all standards, external horizontal, vertical and blanking signals or EAV/SAV codes control the insertion of appropriate synchronisation signals into the digital data stream and therefore the output signals.

The ADV7196A outputs analog YPrPb progressive scan format complying to EIA770.1, EIA 770.2 or YPrPb HDTV complying to EIA 770.3 or RGB complying to RS-170/RS 343A.

The ADV7196A requires a single 3.3V power supply, an optional external 1.235 V reference and a 27 MHz clock in Progressive Scan Mode or a 74.25MHz (or 74.1758MHz) clock in HDTV mode.

Programmable Adaptive Filter Control
Undershoot Limiter
VBI Open Control
I2C Filter

Macrovision Rev 1.0 (525p)
CGMS-A (525p)
2 Wire Serial MPU Interface

Single Supply +3.3 V Operation
52-MQFP package

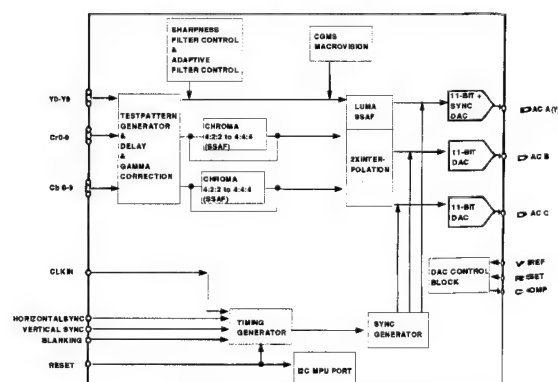

APPLICATIONS

Progressive Scan / HDTV Display Devices
DVD Players
Progressive Scan/HDTV Projection Systems
MPEG2@81MHz
Digital Video Systems
High Resolution Color Graphics
Image Processing/ Instrumentation
Digital Radio Modulation/ Video Signal Reconstruction

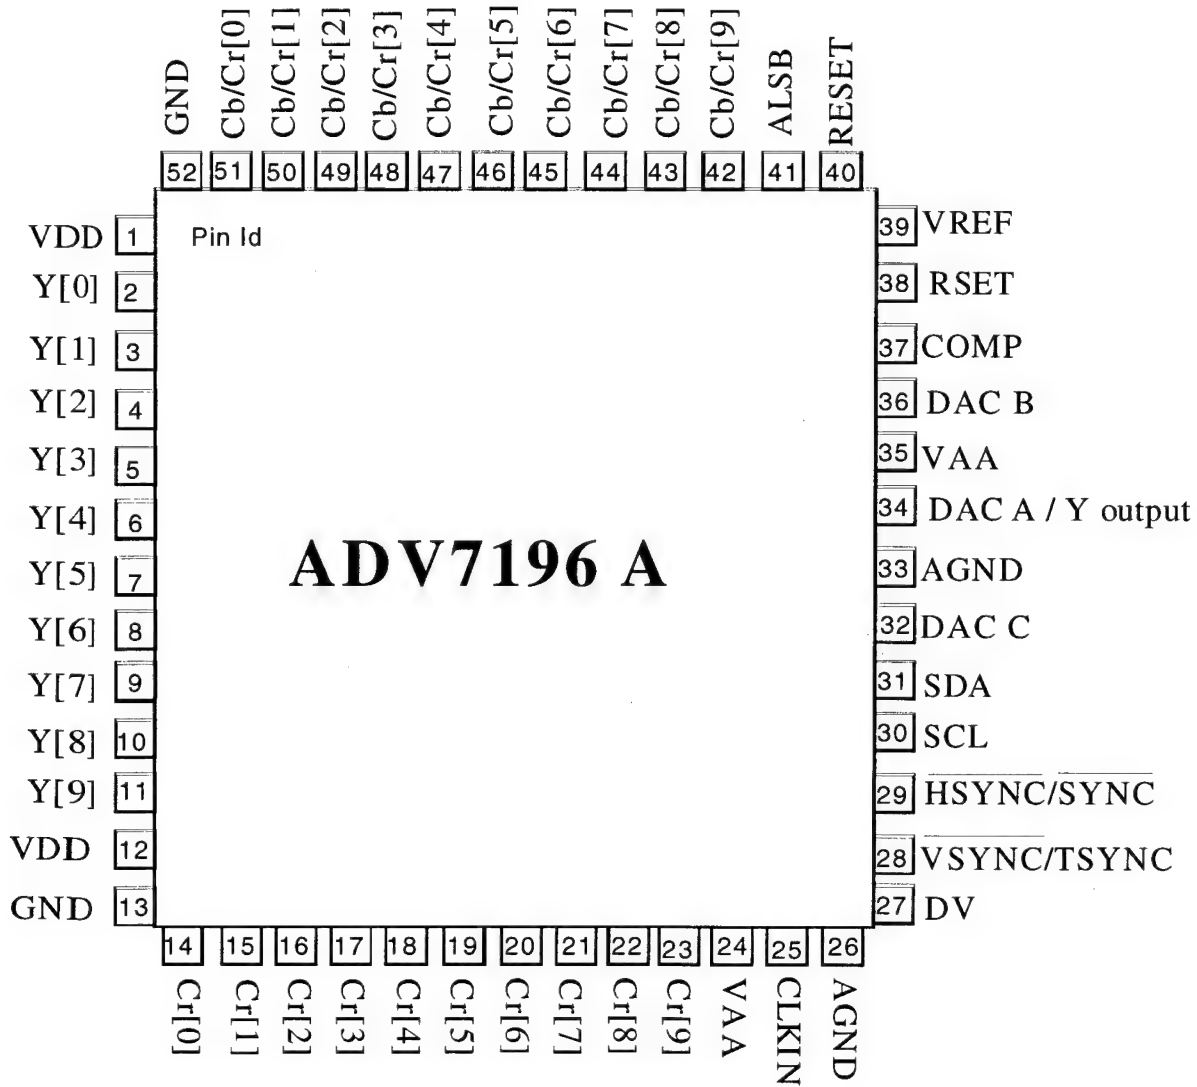

In Progressive Scan Mode, a Sharpness Filter with programmable gain allows high frequency enhancement on the luminance signal. Programmable Adaptive Filter Control which may be used, allows removal of ringing on the incoming Y data. The ADV7196A supports CGM-SA data control generation and the Macrovision Anticopy algorithm in 525p mode.

The ADV7196A is packaged in a 52-Pin MQFP package.

FUNCTIONAL BLOCK DIAGRAM

PIN CONFIGURATION

Pin	Mnemonic	Input/Output	Function
GND	G		Digital Ground
AGND	G		Analog Ground
ALSB	I		TTL Address Input. This signal sets up the LSB of the MPU address. When this pin is tied high the I2C filter is activated which reduces noise on the I2C interface. When this pin is tied low, the input bandwidth on the I2C lines is increased.
DV	I		Video Blanking Control Signal Input.
CLKIN	I		Pixel Clock Input. Requires a 27MHz reference clock for standard operation in Progressive Scan Mode or a 74.25MHz (74.1758MHz) reference clock in HDTV mode.
COMP	O		Compensation Pin for DACs. Connect 0.1μF Capacitor from COMP pin to V _{AA} .
DAC A	O		Y analog output.
DAC B	O		Color component analog output of input data on Cr 9-0 input pins.
DAC C	O		Color component analog output of input data on Cb/Cr 9-0 input pins.
<u>HSYNC/</u> <u>SYNC</u>	I		<u>HSYNC</u> , horizontal sync control signal input or SYNC input control signal in Async Timing Mode.
Cr 9-0	I		10-Bit Progressive scan/ HDTV input port for color data in 4:4:4 input mode. In 4:2:2 mode this input port is not used. Input port for R data when RGB data is input.
Cb/Cr 9-0	I		10-Bit Progressive scan/ HDTV input port for color data. In 4:2:2 mode the multiplexed CrCb data must be input on these pins. Input port for B data when RGB is input.
<u>RESET</u>	I		This input resets the on-chip timing generator and sets the ADV7196A into Default Register setting. Reset is an active low signal.
R _{SET}	I		A 2470 Ohms resistor (for input ranges 64-940 and 64-960, output standards EIA770.1-3) must be connected from this pin to AGND and is used to control the amplitudes of the DAC outputs. For input ranges 0 -1023 (RS-170,RS-343A) the R _{SET} value must be 2820 Ohms.
SCL	I		MPU Port Serial Interface Clock Input
SDA	I/O		MPU Port Serial Data Input/Output
<u>VSNC/</u> <u>TSYNC</u>	I		<u>VSNC</u> , vertical sync control signal input or TSYNC input control signal in Async Timing Mode.
V _{DD}	P		Digital power supply
V _{AA}	P		Analog power supply
V _{REF}	I/O		Optional External Voltage Reference Input for DACs or Voltage Reference Output (1.235V).
Y9 -Y0	I		10-Bit Progressive scan/ HDTV input port for Y data. Input for G data when RGB data is input.

DATA SHEET

NEC

MOS INTEGRATED CIRCUIT

μPD72852**IEEE1394a-2000 COMPLIANT 400 Mbps TWO-PORT PHY LSI**

The μPD72852 is a two-port physical layer LSI that complies with the IEEE1394a-2000 specifications.

The μPD72852 supports transfers of up to 400 Mbps and consumes less power than the μPD72850B. The μPD72852 is suitable for battery systems with an IEEE1394 interface.

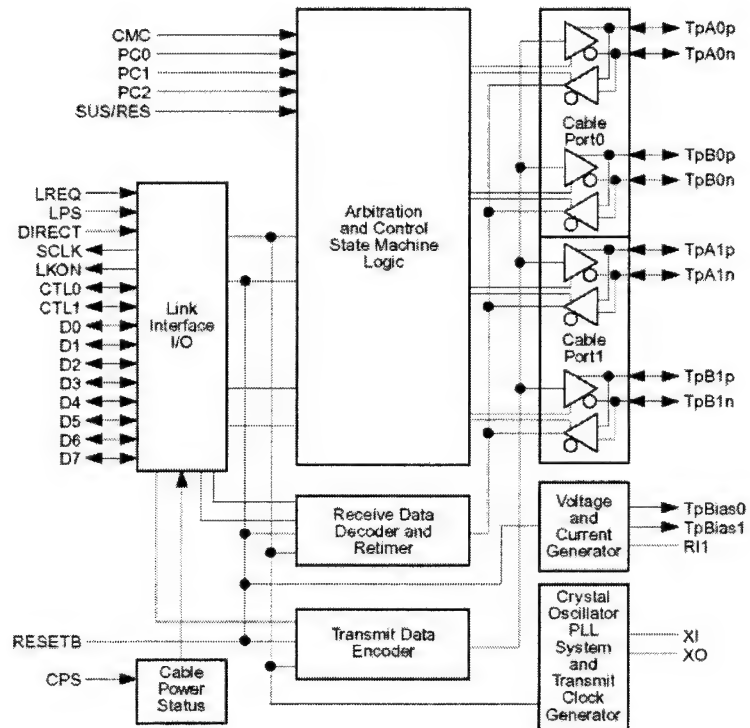

FEATURES

- The two-port physical layer LSI complies with IEEE1394a-2000
- Fully interoperable with IEEE1394 std 1394 Link (FireWire™, i.LINK™)
- Meets Intel™ Mobile Power Guideline 2000
- Full IEEE1394a-2000 support includes: Suspend/Resume, connection debounce, arbitrated short bus reset, multi-speed concatenation, arbitration acceleration, fly-by concatenation
- Fully compliant with OHCI requirements
- Small package: 64-pin plastic LQFP
- Super low power: 68 mA (Operating mode)
: 115 μA (Suspend mode)
- Data rate: 400/200/100 Mbps
- Supports PHY pinging and remote PHY access packets
- 3.3 V single power supply (if power not supplied via node: 3.0 V single power supply)
- 24.576 MHz crystal clock generation, 393.216 MHz PLL multiplying frequency
- 64-bit flexible register incorporated in PHY register
- Electrically isolated Link interface
- Supports LPS/Link-on as part of PHY/Link interface
- External filter capacitors for PLL not required
- Extended Resume signaling for compatibility with legacy DV devices
- System power management by signaling of node power class information
- Cable power monitor (CPS) is equipped

PRELIMINARY DATA SHEET

NEC**MOS INTEGRATED CIRCUIT** **μ PD72893****IEEE1394 LINK LAYER CONTROLLER WITH DV CODEC****DESCRIPTION**

The μ PD72893 is an IEEE1394 link layer controller developed for digital AV systems and features an on-chip 32-bit RISC CPU (V850E) for IEEE1394 processing.

This link layer controller has two stream interface channels to transmit/receive image data conforming to the IEC61883 Standard, such as MPEG and VD, and these channels can be independently used for transmission and reception. In addition, a total of 8 KB of FIFO buffer space is provided to transmit/receive isochronous signals. This buffer space can be allocated as transmit and receive FIFO buffers in 2 KB units.

The μ PD72893 supports IEEE1394 bus control and AV/C commands via the on-chip CPU, as well as external control using either a serial or a parallel interface.

FEATURES**IEC61883 functions**

- Supports DVB, DSS, and DVCR formats.
- Supports AV/C commands (for D-VHS).

DV codec functions

- Supports IEEE1394 DV

Video signal :

NTSC 720 x 480 x 29.97 Hz (525-60 system)
PAL 720 x 576 x 25 Hz (625-50 system)

Audio signal :

2 channels (48 kHz, 44.1 kHz, 32 kHz, 16 bits)
4 channels (32 kHz, 12 bits)

- Supports digital AV signal

Video signal :

ITU-R REC656

8 bits, Y/Cb/Cr 4:2:2 (Video CLK = 27 MHz)

Audio signal :

Audio PCM serial

Input 16-bit resolution MCK44, MCK48

Output LRCKO, BCKO

CPU functions

- 32-bit RISC CPU (V850E)
- Operating frequency : 27 MHz input (@54 MHz internally)
- Memory : ROM 192 KB
RAM 60 KB

Interface functions

- Stream port (MPEG-TS, DV): 2 ports
- 8-bit parallel bus/serial bus support
- Asynchronous transfer format Maximum transfer rate: 13.5 Mbyte/s
- Host interface
- Parallel interface: 16-bit address/data separated type, ISA, 68000, and SH-1 selectable
- ROM interface
- Flash ROM interface. SRAM is also connectable.
- EEPROMTM interface
- For IEEE1394 configuration data
- General-purpose I/O ports: 11 (multiplexed with function pins)

Other functions

- Power-saving function (HALT mode and software STOP mode)
- Supply voltage: Peripheral 3.3 V \pm 0.3 V
Internal 2.5 V \pm 0.2 V
- Package: 208-pin plastic QFP (FP)

NEC**μPD72893****OVERVIEW OF FUNCTIONS**

Product Name	μPD72893
IEEE1394 Link core	<p>Conforms to IEEE1394-1995 and IEEE1394a-2000 Standards.</p> <p>Supports data rates of 400 Mbps, 200 Mbps, and 100 Mbps.</p> <p>Two FIFOs for ASYNC transmission/reception</p> <p>Concatenate Isochronous transmission and asynchronous stream transmission are possible.</p> <p>Conforms to IEC61883.</p> <p>CSR's and Config_ROM (RAM) that are frequently accessed incorporated so that response_packet is automatically generated and transmitted by concatenate transfer.</p>
CPU core	32-bit RISC CPU (V850E)
Internal ROM	192 KB
Internal RAM	60 KB
Parallel interface	- 16-bit address/data separated bus (select one mode from the following bus formats) 6800 (Motorola), ISA, SH-1
Serial interface	- Asynchronous serial interface (UART) x 1 channel - Clocked serial interface (CSI) x 1 channel
External ROM connection function	- Page ROM/ROM flash ROM interface - SRAM interface - EEPROM interface
Operating frequency	- 27 MHz clock input - On-chip CPU: 54 MHz (generated by internal PLL from 27 MHz) - IEEE1394 Link core: 49.152 MHz (operates on SCLK from PHY)
Supply voltage	- Peripheral: $V_{DD} = 3.3 \pm 0.3$ V - Internal: $V_{DD} = 2.5 \pm 0.2$ V
Package	208-pin plastic QFP (fine pitch) (28 x 28)

1. PIN FUNCTIONS

(1) Link-related pins

Pin Name	Pin No.	I/O	Function	Active	After Reset	Alternate Function
LINKON	18	I	Link-on signal input. Clock input. Inputs 0 if LPS is active.	—	I	—
LPS	17	O	Link power status output Link power OFF : 0 Link power ON : 2.7 MHz pulse output (54 MHz host clock divided by 20)	—	O	—
LREQ	16	O	Link request output	—	O	—
SCLK	15	I	Clock input for Link control When LPS is active : 49.152 MHz input LPS = 0 : Fixed to 0	—	I	—
CTL[1:0]	12, 13	I/O	PHY/Link control signal I/O	—	I	—
PHY_D[7:0]	2 to 4, 6 to 8, 10, 11	I/O	Data I/O between PHY and Link	—	I	—
STREAM1[7:0]	26 to 19	I/O	ISO data bus of stream interface 1 ^{Note}	—	I	—
PACKETEN1	27	I/O	Packet enable signal I/O to/from stream interface 1 ^{Note}	H/L	I	—
TSERROR1	28	I/O	Packet error signal I/O to/from stream interface 1 ^{Note}	H/L	I	—
TSRW1	29	I/O	Data read/write enable signal I/O to/from stream interface 1 ^{Note}	—	I	—
SYNC1	30	I/O	Frame sync signal I/O to/from stream interface 1 ^{Note}	H/L	I	—
TSSUB1	32	I/O	I : Inputs the packet gap signal when the stream is input through the stream interface O : Not used. Connect this pin to VDD or GND via a resistor.	H/L	I	—
STREAM2[7:0]	47 to 40	I/O	ISO data bus of stream interface 2 ^{Note}	—	I	VD[7:0]
PACKETEN2	33	I/O	Packet enable signal I/O to/from stream interface 2 ^{Note}	H/L	I	VSYNC
TSERROR2	34	I/O	Packet error signal I/O to/from stream interface 2 ^{Note}	H/L	I	HSYNC
TSRW2	36	I/O	Data read/write enable signal I/O to/from stream interface 2 ^{Note}	—	I	FLD
SYNC2	37	I/O	Frame sync signal I/O to/from stream interface 2. ^{Note}	H/L	I	—
TSSUB2	38	O	Not used. Leave open.	—	O	—

Note When this signal is switched for transmission or reception to/from IEEE1394, it must be controlled that output does not conflict.

To prevent a floating state, connect a pull-up or pull-down resistor to this pin.

Remark Active H/L: A high or low level can be selected as the active level.

NEC**μPD72893****(2) Video interface pins**

Pin Name	Pin No.	I/O	Function	Active	After Reset	Alternate Function
VCLKI	50	I	Video clock input (27 MHz)	—	—	—
VCLKO	51	O	Video clock output (27 MHz)	—	—	—
VD[7:0]	47 to 40	I/O	Video data signal	—	—	STREAM2[7:0]
VSNC	33	I/O	Vertical sync video signal <i>Note</i>	L	—	PACKETEN2
HSNC	34	I/O	Horizontal sync video signal <i>Note</i>	L	—	TSERROR2
FLD	36	I/O	Field index signal <i>Note</i>	—	—	TSRW2
VPWM	53	O	PWM signal for video PLL	—	—	—

Note When this signal is switched for transmission or reception to/from IEEE1394, it must be controlled that output does not conflict.

(3) Audio interface pins

Pin Name	Pin No.	I/O	Function	Active	After Reset	Alternate Function
AMCLK48	104	I	Audio master clock input (for 48 kHz sampling frequency)	—	—	—
AMCLK44	103	I	Audio master clock input (for 44.1 kHz sampling frequency)	—	—	—
AMCLKO	101	O	Audio master clock output	—	—	—
PCM1	96	I/O	Audio PCM serial data <i>Note</i> With 2 channels: CH1 With 4 channels: CH1 or CH1 and CH2 mixed	—	—	—
PCM2	97	I/O	Audio PCM serial data <i>Note</i> With 2 channels: Mute With 4 channels: CH2	—	—	—
AEMP1	98	O	PCM1 emphasis ON/OFF for PCM1 output	H	—	—
AEMP2	100	O	PCM2 emphasis ON/OFF for PCM2 output	H	—	—
ALRCK	93	I/O	Audio LR clock <i>Note</i> L-ch: High R-ch: Low	—	—	—
ABCK	94	I/O	Audio bit clock <i>Note</i>	—	—	—
AFS[1:2]	48, 49	O	Audio sampling frequency AFS2 AFS1 44.1 kHz 0 1 48 kHz 0 0 32 kHz 1 0	—	—	—
APWM	102	O	PWM signal for audio PLL	—	—	—

Note The input changes according to the switching of the encode/decode mode. It must be controlled so that the output does not conflict when the mode is switched.

To prevent a floating state, connect a pull-up or pull-down resistor to this pin.

NEC

 μ PD72893

(4) SDRAM interface pins

Pin Name	Pin No.	I/O	Function	Active	After Reset	Alternate Function
MCLK	77	O	CLK pin connection for SDRAM	—	—	—
MRAS	76	O	RAS pin connection for SDRAM	—	—	—
MCAS	75	O	CAS pin connection for SDRAM	—	—	—
MWE	74	O	WE pin connection for SDRAM	—	—	—
MA[11:0]	92, 90 to 83, 81 to 79	O	Address pin connection for SDRAM	—	—	—
MD[15:0]	73 to 69, 66 to 64, 62 to 57, 55, 54	I/O	Data pin connection for SDRAM These pins must be pulled up or down and then must be directly connected to the SDRAM pins.	—	—	—

(5) Host interface pins

(a) Parallel interface pins

Pin Name	Pin No.	I/O	Function	Active	After Reset	Alternate Function
CS	117	I	Parallel interface chip select input	L	I	—
RWZ	119	I	Parallel interface read/write control input ISA bus, SH-1 bus : Write strobe 68000 bus : Read/write select signal	L	I	—
IOR	120	I	Parallel interface IO read control input ISA bus, SH-1 bus : Read strobe 68000 bus : Data strobe (DS)	L	I	—
IOCHRDY	123	O	Parallel interface ready output	L	O	—
AD[10:1]	116 to 107	I	Parallel interface address input	—	I	—
P_D[15:0]	143 to 141, 139 to 132, 130 to 128, 126, 125	I/O	Parallel interface data input/output	—	I	—
DMAREQ	122	O	DMA request output	L	O	SIO_CNT0
DMAACK	121	I	DMA acknowledge input for parallel interface	L	I	SIO_CNT1

NEC**μPD72893****(b) Serial interface pins**

Pin Name	Pin No.	I/O	Function	Active	After Reset	Alternate Function
SO	145	O	Serial transmit data output for clocked serial interface (CSI)	—	O	P40
SI	146	I	Serial receive data input for clocked serial interface (CSI)	—	I	P41
SCK	147	O	Clock output for clocked serial interface (CSI)	—	O	P42
TXD	149	O	Serial transmit data output for asynchronous serial interface (UART)	—	O	P43
RXD	150	I	Serial transmit data input for asynchronous serial interface (UART)	—	I	P44
SCS	151	O	Chip select output for clocked serial interface (CSI)	—	O	P45
SIO_CNTI	121	I	Control input for asynchronous serial interface (UART) Externally input data is loaded in synchronization with the end of RXD of UART.	—	I	DMAACK
SIO_CNTO	122	O	Control output for asynchronous serial interface (UART)	—	O	DMAREQ

(c) Others

Pin Name	Pin No.	I/O	Function	Active	After Reset	Alternate Function
INT	124	O	Interrupt output to external device	H	O	—
PSSEL[1:0]	106, 105	I	Parallel/serial interface selection. These signals select a parallel or serial interface as the external interface. PSSEL[1:0] Selected interface 00 Serial interface (UART) 01 Parallel interface (ISA bus) 10 Parallel interface (68000 bus) 11 Parallel interface (SH-1 bus)	—	I	—

NEC**μPD72893****(6) Port pins**

Pin Name	Pin No.	I/O	Function	Active	After Reset	Alternate Function
P30	204	I/O	Port 3.	-	I	-
P31	152		This is a 4-bit I/O port that can be set in the input or output mode in 1-bit units. P30 : Connect this pin to GND via a resistor. P32 : This pin outputs an interrupt to the external device to read the DV status. It cannot be used as a port pin when DV is used.			-
P32	153					-
P33	154					-
P34	155					-
P40	145	I/O	Port 4.	-	I	SO
P41	146		This is a 6-bit I/O port that can be set in the input or output mode in 1-bit units.			SI
P42	147					SCK
P43	149		P40 to P45 are multiplexed with the pins described under the heading Alternate Function (they cannot be used as general-purpose port pins).			TXD
P44	150					RXD
P45	151					SCS

(7) External ROM connection pins

Pin Name	Pin No.	I/O	Function	Active	After Reset	Alternate Function
D[15:0]	196, 194 to 189, 186 to 178	I/O	External ROM data bus External ROM data bus used to access external ROM	-	I	-
A[17:1]	175, 174, 172, 171, 169 to 167, 165 to 156	O	External ROM address bus External ROM address bus used to access external ROM. A space of 256 KB can be addressed.	-	O	-
RDZ	176	O	ROM read This is a strobe signal that indicates a read cycle to the external ROM. It is inactive in the idle state.	L	O	-
WRZ	177	O	ROM write This is a strobe signal that indicates a write cycle to the external ROM.	L	O	-

NEC

 μ PD72893

(8) Clock and reset pins

Pin Name	Pin No.	I/O	Function	Active	After Reset	Alternate Function									
RESETB	1	I	<p>Reset.</p> <p>RESETB is asynchronous input. If a signal with a specified low-level width is input to this pin independently of the operating clock, a system reset is effected, taking precedence over all the other operations.</p> <p>This signal can also be used to clear the power-saving mode (HALT or software STOP), as well as for normal initialization and starting.</p> <p>Caution RESETB is active-low.</p>	L	I	—									
HS_CLK	202	I	<p>Host clock.</p> <p>This pin inputs the clock that is to be supplied to the CPU core and internal peripheral I/O. This clock is input to the internal clock generator. An internal clock is generated according to the value of HCLKSEL and is supplied to the CPU core and internal peripheral I/O. Usually, input a clock of 27 MHz to this pin.</p>	—	I	—									
HCLKSEL	197	I	<p>Host clock selection.</p> <p>This pin inputs the clock that is to be supplied to the CPU core and internal peripheral I/O. The relationship between the clock supplied by the HS_CLK pin (27 MHz) and the clock supplied to the CPU core and internal peripheral I/O is as follows:</p> <table><tr><td>HCLKSEL</td><td>Internal clock frequency</td><td>PLL operation</td></tr><tr><td>0</td><td>54 MHz</td><td>Multiplied by 2</td></tr><tr><td>1</td><td>Clock stops.</td><td>PLL operation stops.</td></tr></table>	HCLKSEL	Internal clock frequency	PLL operation	0	54 MHz	Multiplied by 2	1	Clock stops.	PLL operation stops.	—	I	—
HCLKSEL	Internal clock frequency	PLL operation													
0	54 MHz	Multiplied by 2													
1	Clock stops.	PLL operation stops.													

NEC**μPD72893****(9) Power supply, ground, and others**

Pin Name	Pin No.	I/O	Function	Active	After Reset	Alternate Function
3.3V _{DD}	5, 31, 52, 63, 78, 95, 127, 140, 166, 187	—	3.3 V power supply. Supplies a positive voltage of 3.3 V to the I/O pins of the 3.3 V interface.	—	—	—
2.5V _{DD}	14, 67, 118, 170	—	2.5 V power supply. Supplies a positive voltage of 2.5 V to the respective internal blocks.	—	—	—
2.5GND	39, 91, 144, 195	—	Ground. These are ground pins. Connect all GND pins to a common ground.	—	—	—
3.3GND	9, 35, 56, 68, 82, 99, 131, 148, 173, 188					
PLLAV _{DD}	199	—	Analog power supply to multiplication circuit. Supplies a positive analog voltage to the PLL. Supply 2.5 V to this pin.	—	—	—
PLLAGND	200	—	Analog ground for multiplication circuit. Analog ground pin for PLL.	—	—	—
PLLDV _{DD}	198	—	Digital power supply to multiplication circuit. Supplies a positive digital voltage to the PLL. Supply 2.5 V to this pin.	—	—	—
PLLDGND	201	—	Digital ground for multiplication circuit. Digital ground pin for PLL.	—	—	—
IC(L)	203, 205 to 207	—	Internally connected pins Directly connect these pins to ground.	—	—	—
IFIROME	208	I	Internal ROM/external ROM select input 0: External ROM mode 1: Internal ROM mode	—	I	—

NEC**μPD72893****1.2 Connection of Unused Pins**

The following table shows how to connect unused pins.

Table 1-1. Connection of Unused Pins (1/2)

Pin Name	I/O	Interface	Recommended Connection of Unused Pin	
PHY_D[7:0]	I/O	I/O Buffer (LVTTL) in 9 mA	Connect these pins to V _{DD} or GND via a resistor.	
CTL[1:0]		With Bus Holder		
SCLK	I	I/O Buffer (LVTTL) with bus holder		
LREQ	O	3-state Output Buffer (LVTTL) 9 mA	Leave open	
LPS	O	Output Buffer (LVTTL) 9 mA

9.9.3 IC7802: μ PD78F0988A

DATA SHEET

NEC**MOS INTEGRATED CIRCUIT**
 μ PD78F0988A, 78F0988A(A)**8-BIT SINGLE-CHIP MICROCONTROLLERS****DESCRIPTION**

The μ PD78F0988A and 78F0988A(A) are products in the μ PD780988 Subseries in the 78K/0 Series that have flash memory in the place of the internal ROM of the μ PD780988. Flash memory can be written or erased electrically with the device mounted on the board. Therefore, the μ PD78F0988A and μ PD78F0988A(A) are ideal for evaluation in system development, small-scale production, or systems likely to be upgraded frequently.

Detailed function descriptions are provided in the following user's manuals. Be sure to read them before designing.

μ PD780988 Subseries User's Manual: U13029E

78K/0 Series Instruction User's Manual: U12326E

FEATURES

- Pin-compatible with mask ROM version (except V_{PP} pin)
- Flash memory: 60 KB^{Note 1}
- Internal high-speed RAM: 1024 bytes
- Internal expansion RAM: 1024 bytes^{Note 2}
- Operable in the same supply voltage range as the mask ROM version ($V_{DD} = 4.0$ to 5.5 V)

- Notes**
1. The capacity of the flash memory can be changed with the internal memory size switching register (IMS).
 2. The capacity of the internal expansion RAM can be changed with the internal expansion RAM size switching register (IXS).

Remark For the differences between the flash memory versions and the mask ROM versions, refer to

1. DIFFERENCES BETWEEN μ PD78F0988A AND MASK ROM VERSIONS.

ORDERING INFORMATION

Part Number	Package	Quality Grade
μ PD78F0988ACW	64-pin plastic SDIP (19.05 mm (750))	Standard (for general electrical equipment)
μ PD78F0988AGC-AB8	64-pin plastic QFP (14 × 14)	Standard (for general electrical equipment)
μ PD78F0988AGC-8BS	64-pin plastic LQFP (14 × 14)	Standard (for general electrical equipment)
μ PD78F0988AGC(A)-AB8	64-pin plastic QFP (14 × 14)	Special (for high-reliability electrical equipment)
μ PD78F0988AGC(A)-8BS	64-pin plastic LQFP (14 × 14)	Special (for high-reliability electrical equipment)

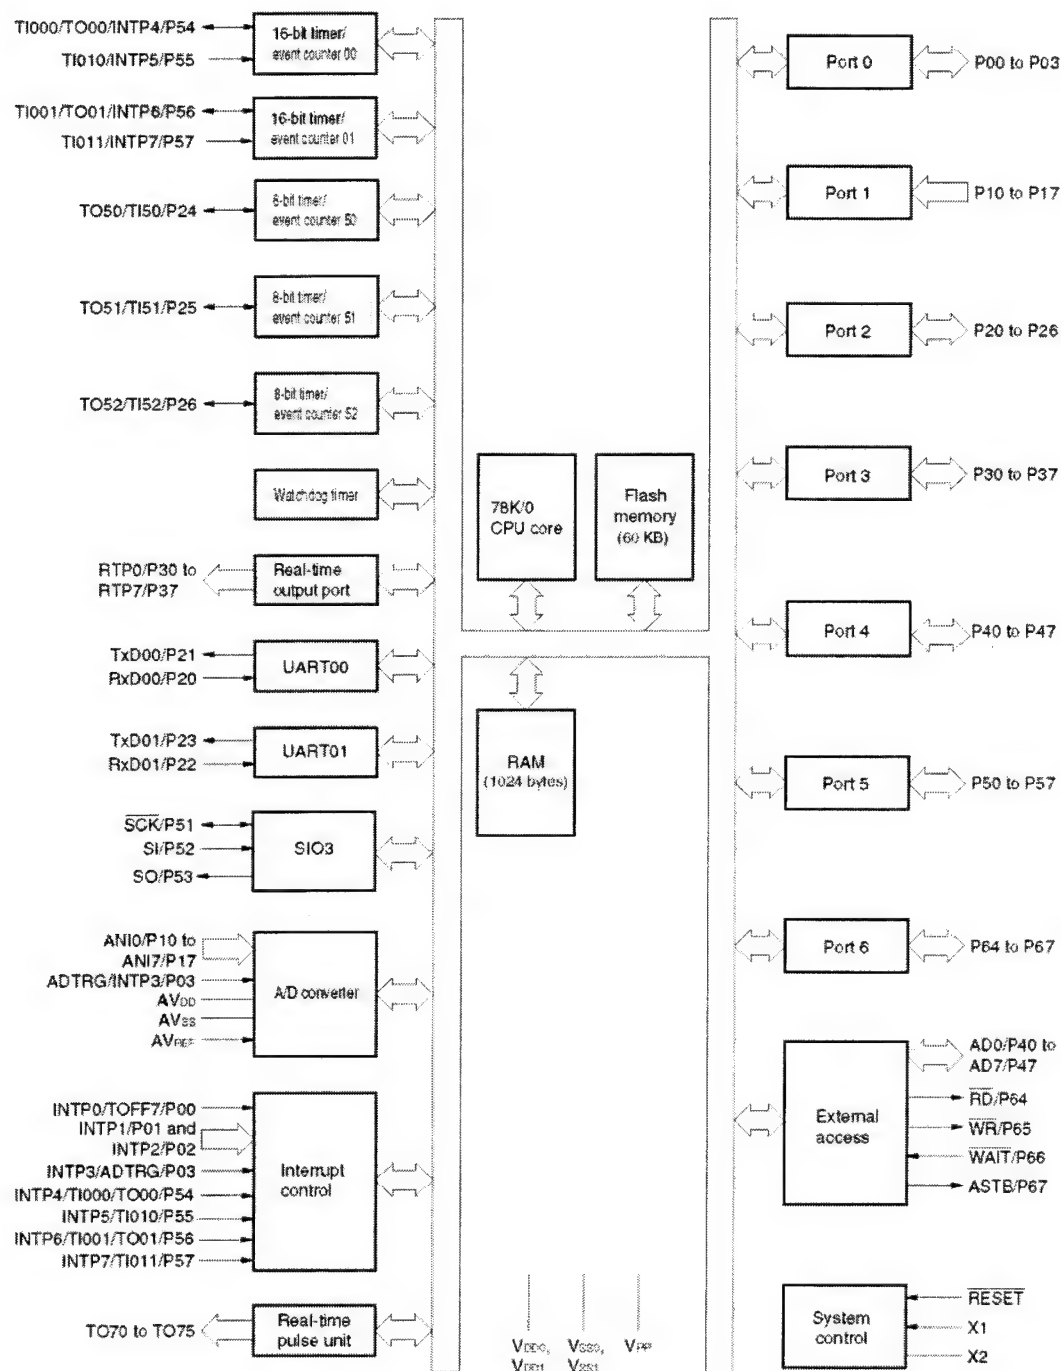

For details of the quality grade and its application fields, refer to **Quality Grades on NEC Semiconductor Devices (C11531E)**.

INTP3			Input	P03/ADTRG
INTP4			Input	P54/TI000/TO00
INTP5			Input	P55/TI010
INTP6			Input	P56/TI001/TO01
INTP7			Input	P57/TI011
TI50	Input	External count clock input to 8-bit timer/event counter 50	Input	P24/TO50
TI51		External count clock input to 8-bit timer/event counter 51	Input	P25/TO51
TI52		External count clock input to 8-bit timer/event counter 52	Input	P26/TO52
TI000		External count clock input to 16-bit timer/event counter 00 Capture trigger input to capture register (CR000, CR010) of 16-bit timer/event counter 00	Input	P54/INTP4/TO00
TI010		Capture trigger input to capture register (CR000) of 16-bit timer/event counter 00	Input	P55/INTP5
TI001		External count clock input to 16-bit timer/event counter 01 Capture trigger input to capture register (CR001, CR011) of 16-bit timer/event counter 01	Input	P56/INTP6/TO01
TI011		Capture trigger input to capture register (CR001) of 16-bit timer/event counter 01	Input	P57/INTP7
TO50	Output	8-bit timer/event counter 50 output	Input	P24/TI50
TO51		8-bit timer/event counter 51 output	Input	P25/TI51
TO52		8-bit timer/event counter 52 output	Input	P26/TI52
TO00		16-bit timer/event counter 00 output	Input	P54/INTP4/TI000
TO01		16-bit timer/event counter 01 output	Input	P56/INTP6/TI001
RTP0 to RTP7	Output	Real-time output port that outputs pulses in synchronization with trigger signals outputs from the real-time pulse unit	Input	P30 to P37
TxD00	Output	Asynchronous serial interface serial data output	Input	P21
TxD01			Input	P23
RxD00	Input	Asynchronous serial interface serial data input	Input	P20
RxD01			Input	P22
SCK	I/O	Serial interface serial clock input/output	Input	P51
SI	Input	Serial interface serial data input	Input	P52
SO	Output	Serial interface serial data output	Input	P53
ANI0 to ANI7	Input	A/D converter analog input	Input	P10 to P17
ADTRG	Input	External trigger signal input to the A/D converter	Input	P03/INTP3
TO70 to TO75	Output	Timer output for the 3-phase PWM inverter control	Hi-Z	-
TOFF7	Input	Timer output (TO70 to TO75) stop external input	Input	P00/INTP0
AD0 to AD7	I/O	Address/data bus for expanding memory externally	Input	P40 to P47
RD	Output	Strobe signal output for reading from external memory	Input	P64
WR		Strobe signal output for writing to external memory	Input	P65
WAIT	Input	Wait insertion at external memory access	Input	P66
ASTB	Output	Strobe output that externally latches address information output to ports 4 and 5 to access external memory	Input	P67
AV _{REF}	Input	A/D converter reference voltage input	-	-
AV _{DD}	-	A/D converter analog power supply	-	-

NEC**μPD78F0988A, 78F0988A(A)****3.2 Non-Port Pins (2/2)**

Pin Name	I/O	Function	After Reset	Alternate Function
AV _{SS}	—	A/D converter ground potential	—	—
RESET	Input	System reset input	—	—
X1	Input	Connecting crystal resonator for system clock oscillation	—	—
X2	—		—	—
V _{DDP}	—	Positive power supply for ports	—	—
V _{SSP}	—	Ground potential for ports	—	—
V _{DD1}	—	Positive power supply except for ports	—	—
V _{SS1}	—	Ground potential except for ports	—	—
V _{PP}	—	High-voltage application during program write/verify. In the normal operation mode, connect directly to V _{SS0} .	—	—

NEC**μPD78F0988A, 78F0988A(A)****3.3 Pin I/O Circuits and Recommended Connection of Unused Pins**

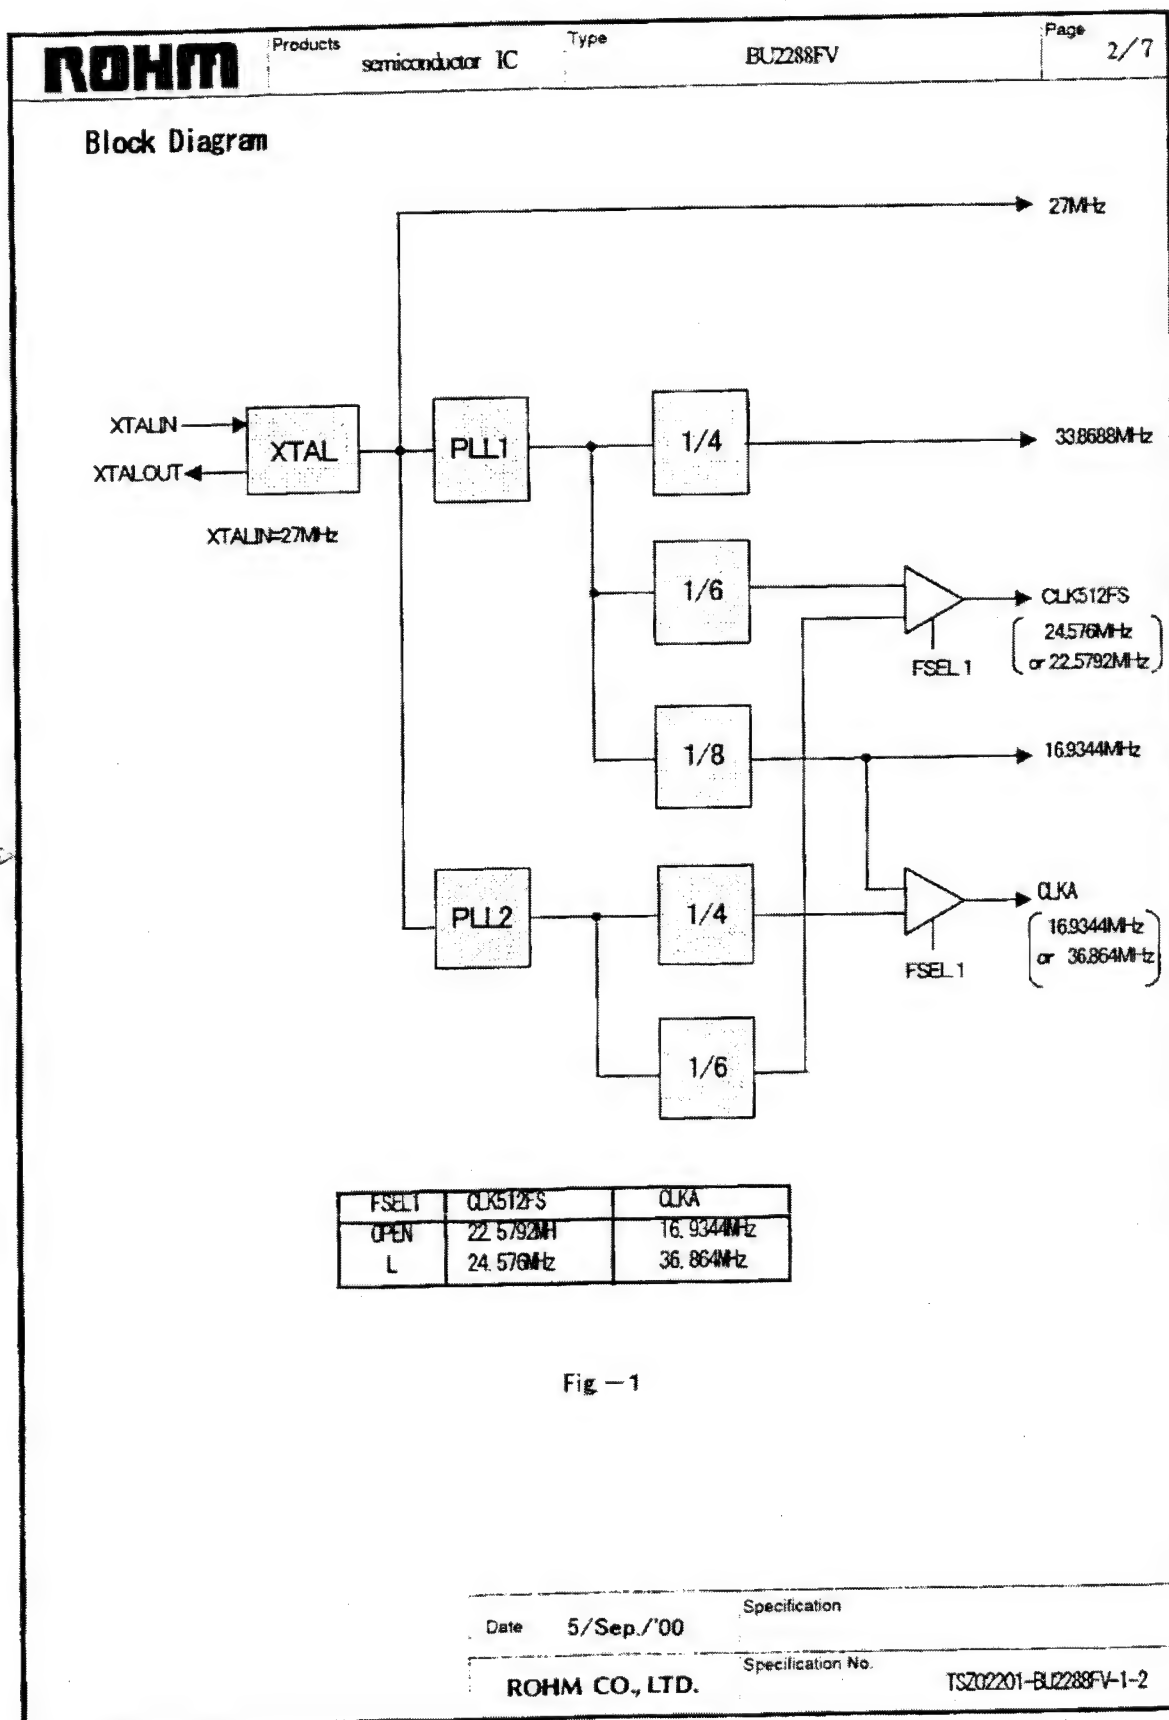

The I/O circuit type of each pin and recommended connection of unused pins are shown in Table 3-1.

For the I/O circuit configuration of each type, refer to Figure 3-1.

Table 3-1. Types of Pin I/O Circuits

Pin Name	I/O Circuit Type	I/O	Recommended Connection of Unused Pins
P00/INTP0/TOFF7	8-C	I/O	Input: Independently connect to V_{SS} via a resistor. Output: Leave open
P01/INTP1			
P02/INTP2			
P03/INTP3/ADTRG			
P10/ANI0 to P17/ANI7	25	Input	Independently connect to V_{DD} or V_{SS} via a resistor.
P20/RxD00	8-C	I/O	Input: Independently connect to V_{DD} or V_{SS} via a resistor. Output: Leave open.
P21/TxD00	5-H		
P22/RxD01	8-C		
P23/TxD01	5-H		
P24/TI50/TO50	8-C		
P25/TI51/TO51			
P26/TI52/TO52			
P30/RTP0 to P37/RTP7	5-H		
P40/AD0 to P47/AD7			
P50			
P51/SCK	8-C		
P52/SI	5-H		
P53/SO			
P54/INTP4/TI000/TO00			
P55/INTP5/TI010			
P56/INTP6/TI001/TO01			
P57/INTP7/TI011			
P64/RD			
P65/WR			
P66/WAIT			
P67/ASTB			
TO70 to TO75	4	Output	Leave open.
RESET	2	Input	—
AV _{DD}	—	—	Connect to V_{DD} .
AV _{REF}			Connect to V_{SS} .
AV _{SS}			Connect directly to V_{SS} .
V _{PP}

Explanation for terminal function

PIN No.	PIN NAME	FUNCTION
1	VDD2	Digital VDD for 27MHz clock output
2	VSS2	Digital GND for 27MHz clock output
3	CLK27M	27MHz clock output
4	TEST	Output for test
5	AVDD	Analog VDD
6	AVSS	Analog GND
7	XTALOUT	Standard crystal output
8	XTALIN	Standard crystal input
9	CLKA	clock output (FSEL1=Open:16.9344MHz, FSEL1=L:36.864MHz)
10	CLK512FS	clock output (FSEL1=Open:22.5792MHz, FSEL1=L:24.576MHz)
11	DVSS	Digital GND
12	DVDD	Digital VDD
13	CLK16M	16.9344MHz clock output
14	FSEL1	Output select :with pull-up Open:16.9344MHz (9pin), 22.5792MHz (10pin) L :36.864MHz (9pin), 24.576MHz (10pin)
15	CLK33M	33.8688MHz clock output
16	OE	Output enable (open:enable, L:disable) :with pull-up

ROHM		Products		Type		Page
		Semiconductor IC		BA7082F		7/8
No.	Symbol	IN	OUT	normal Voltage	Internal pin configuration	Description
1	SW1		○	L 0.1V		Pin 1-3 are output pins at LOGIC parts for adjustment frequency sensitivity. These pins are open collector output.
2	SW2			—		
3	SW3			OPEN 5V		
4	BW	○		—		Pin 4,5 are input pins at logic parts for adjustment frequency sensitivity.
5	BWB					
6	1/2FB					Pin 6 is input pin at LOGIC parts for adjustment frequency sensitivity and changing 1/2 Frequency demultiplier. "H" is through output. and "L" is 1/2 Frequency demultiplier output.
7	Fout		○	3.6V		VCO Output.
8	GND	—	—	0V	GND	GND
9	FADJ	—	—	2.5V		Pin9 is a pin to adjust f0. It is possible to adjust f0 by added resistor (RADJ). If Value of RADJ down, oscillation frequency up. (Use to RADJ > 22kΩ).

9.10 List of Abbreviations

Digital Board

+12V
 +12V Power Supply
 +2V5_FLI
 +2V5 Power Supply for FLI
 +2V5_PLL
 +2V5 Power Supply for PLL
 +3V3
 +3V3 Power Supply
 +3V3_ANA
 +3V3 Power Supply Analogue
 +3V3_DD
 +3V3 Power Supply Digital
 +3V3_FLI
 +3V3 Power Supply for FLI
 +5V
 +5V Power Supply
 +5V_BUFFER
 +5V Power Supply for Video Filters
 5508_HS
 Horizontal Synchronisation from Host Decoder to Progressive Scan
 5508_ODD_EVEN
 Odd - Even control from Host Decoder to Progressive Scan
 -5V
 -5V Power Supply
 -5V_BUFFER
 -5V Power Supply for Video Filters
 A_EMPRESS(13:0)
 EMPRESS address output to SDRAM
 ACC_ACLK_OSC
 Audio Clock PLL output sync with incoming video for record
 ACC_ACLK_PLL
 Audio Clock PLL output for play back
 ACLK_EMP
 EMPRESS audio clock output
 AD_ACLK
 Audio Decoder Clock
 AD_BCLK
 Audio Decoder I2S bit clock
 AD_DATAO
 Audio Decoder Output data (PCM)
 AD_SPDIF33
 Audio digital output to the analog board
 AD_WCLK
 Audio Decoder I2S word clock
 AE_ACLK
 Audio Encoder Clock
 AE_ACLK_OEN
 Audio Encoder Clock Output Enable
 AE_BCLK
 Audio Encoder I2S bit clock
 AE_BCLK_DV
 Audio Encoder I2S bit clock to DVIO
 AE_BCLK_VSM
 Audio Encoder I2S bit clock to VSM
 AE_DATAI
 Audio Encoder Input data (PCM)
 AE_DATAI_DV
 Audio Encoder Input data (PCM) from DVIO
 AE_DATAO
 Audio Encoder Output data (PCM)
 AE_WCLK
 Audio Encoder I2S word clock
 AE_WCLK_DV
 Audio Encoder I2S word clock to DVIO
 AE_WCLK_VSM
 Audio Encoder I2S word clock to VSM
 ANA_WE
 Analogue write enable
 ANA_WE_LV
 Analogue write enable Low Voltage

B_IN_VIP
 Video blue input to Video Input Processor
 B_OUT
 Video blue output from Host Decoder
 B_OUT_B
 Filtered blue video output
 BA
 Bank Address
 BCLK_CTL_SERVICE
 Bitclock control Service Interface
 BE_BCLK
 Basic Engine I2S bit clock
 BE_BCLK_VSM
 Basic Engine I2S bit clock to VSM
 BE_CPR
 Basic Engine Control Processor ready to accept data
 BE_DATA_RD
 Basic Engine Data read
 BE_DATA_WR
 Basic Engine Data write
 BE_FAN
 Basic Engine FAN
 BE_FLAG
 Basic Engine error flag
 BE_IRQN
 Basic Engine interrupt request
 BE_LOADN
 Basic Engine LOAD(LOW active)
 BE_RXD
 Basic Engine S2B received data
 BE_SUR
 Basic Engine servo unit ready to accept data (S2B)
 BE_SYNC
 Basic Engine sector/abs time sync
 BE_TXD
 Basic Engine S2B transmitted data
 BE_V4
 Basic Engine versatile input pin
 BE_WCLK
 Basic Engine I2S word clock
 C_IN
 Video Chrominance input
 C_IN_VIP
 Chrominance input to Video Input Processor
 C_OUT
 Chrominance output from Host Decoder
 C_OUT_B
 Filtered Chrominance output
 CAS
 Column Address strobe
 CB_OUT(9:0)
 Chrominance Blue out
 CLK4
 SDRAM clock
 CPUINT0
 Control processor unit interrupt
 CPUINT1
 Control processor unit interrupt
 CR_OUT(9:0)
 Chrominance Red out
 CTS1P
 Clear to send (Service Interface)
 CVBS_OUT
 Composite video output out of the Host Decoder
 CVBS_OUT_B
 Filtered Composite video output
 CVBS_OUT_B_VIP
 Composite video output to Video Input Processor(digital board video loop)
 CVBS_Y_IN
 Composite video/Luminance input
 CVBS_Y_IN_A
 Composite video/Luminance input to Video Input Processor
 CVBS_Y_IN_B
 Composite video/Luminance input to Video Input Processor

CVBS_Y_IN_C	Host Decoder SDRAM data mask enable(Lower)
Composite video/Luminance input to Video Input Processor	HD_M_DQMU
D_ADDR(10:0)	Host Decoder SDRAM data mask enable(Upper)
Address bus	HD_M_RASN
D_DATA(29:0)	Host Decoder SDRAM row address strobe
Data bus	HD_M_WEN
D_EMPRESS(15:0)	Host Decoder SDRAM write enable
SDRAM data input/output of EMPRESS	HSOUT
D_PAR_D(7:0)	Horizontal synchronisation OUT
Front-end parallel interface data (record)	ION
D_PAR_DVALID	Inverted ON: Enable the power supply for the digital board when LOW
Front-end parallel interface data valid	IRESET_DIG
D_PAR_REQ	Initialisation of the digital board, HIGH when power ON
Front-end parallel interface request	JTAG3_TCK
D_PAR_STR	JTAG Test Clock
Front-end parallel interface strobe	JTAG3_TD_VIP_TO_VE
D_PAR_SYNC	JTAG Transmitted Data Video Input Processor to Video Encoder
Front-end parallel interface sync	JTAG3_TD_VSM_TO_VIP
DV_IN_CLK	JTAG Transmitted Data Versatile Stream Manager to Video Input Processor
Digital Video in clock from DVIO board	JTAG3_TMS
DV_IN_DATA(7:0)	JTAG Test Mode Select
Digital Video in data bus from DVIO board	JTAG3_TRSTN
DV_IN_HS	JTAG Test part ResetN
Digital Video in horizontal synchronisation from DVIO board	LOAD_DVN
DV_IN_VS	LOAD Digital Video(LOW active)
Digital Video in vertical synchronisation from DVIO board	MUTEN
EMI_A(21:1)	Mute enable
External Memory Interface Address Bus(Host Decoder)	MUTEN_LV
EMI_BE0N	Mute enable Low Voltage
External Memory Interface Lower byte enable(Host Decoder)	P_SCAN_YUV(7:0)
EMI_BE1N	Progressive Scan digital video bus
External Memory Interface Upper byte enable(Host Decoder)	R_IN_VIP
EMI_CAS0N	Video Red input to Video Input Processor
External Memory Interface SDRAM column address strobe(Host Decoder)	R_OUT
EMI_CE1N	Video Red output from Host Decoder
External Memory Interface VSM Lower bank enable	R_OUT_B
EMI_CE2N	Filtered Red Video output from Host Decoder
External Memory Interface VSM Higher bank enable	RAS
EMI_CE3N	Row Address Strobe
External Memory Interface flash IC's enable	RESETN
EMI_D(15:0)	Reset Host Decoder
External Memory Interface Data Bus(Host Decoder)	RESETN_BE
EMI_PROCCLK	System reset basic engine (buffered)
External Memory Interface Processor Clock(Host Decoder)	RESETN_DVIO
EMI_RWN	System reset Digital Video Input Output (buffered)
External Memory Interface Read/Write control signal(Host Decoder)	RESETN_VE
EMI_WAIT	System reset Video Encoder
External Memory Interface Wait state request(Host Decoder)	ROMH_CEN
EMPRESS_BOOT	Flash 2 chip enable
EMPRESS BOOT select input	ROML_CEN
EMPRESS_IRQN	Flash 1 chip enable
EMPRESS Interrupt request output	RSTN_BE
FLASH_OEN	Reset control of basic engine
FLASH output enable control signal	RSTN_DVIO
G_IN_VIP	Reset control of DVIO
Video green input to Video Input Processor	RTS1P
G_OUT	Ready To Send data to service serial interface
Video green output from Host Decoder	RX1P
G_OUT_B	Receive data from service serial interface
Filtered green video output from Host Decoder	SCL
GNDD	I2C bus clock
Digital Ground	SD_CASN
HD_M_AD(13:0)	SDRAM Column Address strobe output (active LOW)
Host Decoder SDRAM address bus	SD_CLK
HD_M_CASN	SDRAM clock output
Host Decoder SDRAM column address strobe	SD_CLKE
HD_M_CLK	SDRAM clock enable output
Host Decoder SDRAM clock	SD_CSN
HD_M_CS0N	SDRAM
Host Decoder SDRAM chip select	SD_DQM(1:0)
HD_M_DQ(15:0)	SDRAM data mask enable output
Host Decoder SDRAM data bus	SD_RASN
HD_M_DQML	

SDRAM row address strobe output	VDDA2A_7118
SD_WEN	Power supply for analog input of VIP
SDRAM write enable output	VDDA3A_7118
SDA	Power supply for analog input of VIP
I2C bus data	VDDA4A_7118
SEL_ACLK1	Power supply for analog input of VIP
Select audio clock(playback)	VDDE_7118
SM_CS3N	Power supply digital for peripheral cells of VIP
SRAM chip select	VDDI_7118
SM_LBN	Power supply digital for core of VIP
SRAM lower bank	VDDX_7118
SM_OEN	Power supply for crystal oscillator of VIP
SRAM output enable	VE_DATA(7:0)
SM_UBN	Video Encoder data Bus
SRAM upper bank	VE_DSN
SM_WEN	Video Encoder Data Strobe
SRAM write enable	VE_DTACKN
SMA(17:0)	Video Encoder Data Transfer acknowledge
SRAM address output	VIP_ERROR
SMD(15:0)	Video Input Processor error
SRAM data input/output	VIP_FB
SYSCLK_EMPRESS	Video Input Processor Fast Blanking
System clock EMPRESS	VIP_FID_FF
SYSCLK_PROGSCAN	Video Input Processor field identifier to Flip Flop
System clock Progressive Scan	VIP_HS
SYSCLK_VSM_5508	Video Input Processor horizontal synchronisation
System clock VSM and Host decoder	VIP_ICLK
TX1P	Video Input Processor input Clock
Transmit data to service serial interface	VIP_IDQ
U_IN	Video Input Processor output data qualifier
Video U input	VIP_IGP1
U_IN_VIP	Video Input Processor input general purpose 1
Video U input to Video Input Processor	VIP_INT
V_IN	Video Input Processor interrupt
Video V input	VIP_RTS1
V_IN_VIP	Video Input Processor ready to send
Video V input to Video Input Processor	VIP_VS
VCC3_CLK_BUF	Video Input Processor vertical synchronisation
Power supply 3V3 clock buffer	VIP_YUV(7:0)
VCC3_VSM	Video Input Processor digital video(CCIR 656)
Power supply 3V3 Versatile Stream Manager	VS_IN
VCC3_VSM_MEM	Vertical synchronisation IN
Power supply 3V3 Versatile Stream Manager Memory	VSM_M_A(13:0)
VCC5_4046	Versatile Stream Manager SDRAM address bus
Power supply 5V to PLL IC	VSM_M_CASN
VDD_125	Versatile Stream Manager SDRAM column address strobe
Power supply 5V to buffer 7202	VSM_M_CLKEN
VDD_CORE	Versatile Stream Manager SDRAM clock enable
Sti5508 Core supply voltage 2.5V	VSM_M_CLKOUT
VDD_EMP	Versatile Stream Manager SDRAM clock out
Empress supply voltage 3.3V	VSM_M_D(15:0)
VDD_EMP_CORE	Versatile Stream Manager SDRAM data bus
Empress Core supply voltage 2.5V	VSM_M_LDQM
VDD_FLASH_H	Versatile Stream Manager SDRAM lower data mask enable
Flash 7301 supply voltage	VSM_M_RASN
VDD_FLASH_L	Versatile Stream Manager SDRAM row address strobe
Flash 7302 supply voltage	VSM_M_UDQM
VDD_LVC32	Versatile Stream Manager SDRAM upper data mask enable
Power supply LVC32	VSM_M_WEN
VDD_PCM	Versatile Stream Manager SDRAM write enable
Power supply Audio decoder of Sti5508	VSM_UART1_CTSN
VDD_PLL	Versatile Stream Manager UART1 clear to send to analog board (UART1 is gateway to analog board)
Power supply PLL audio decoder of Sti5508	VSM_UART1_RTSN
VDD_RGB	Versatile Stream Manager UART2 clear to send to DVIO board (UART2 is gateway to DVIO board)
Power supply video encoder of Sti5508	VSM_UART1_RX
VDD_STI	Versatile Stream Manager UART1 ready to send to analog board
Power supply of Sti5508	VSM_UART1_TX
VDD_YCC	Versatile Stream Manager UART2 ready to send to DVIO board
Power supply video encoder of Sti5508	VSM_UART2_CTSN
VDD5_MK2703	Versatile Stream Manager UART1 received data to analog board
Power supply MK2703	
VDD5_OSC	
Power supply Oscillator	
VDDA1A_7118	
Power supply for analog input of VIP	

VSM_UART2_RTSN	Buffer Enable Video
Versatile Stream Manager UART2 received data to DVIO board	CLK27M_CON
VSM_UART2_RX	27MHz Clock to Digital Board
Versatile Stream Manager UART1 transmitted data to analog board	CS
VSM_UART2_TX	Parallel interface chip select input of Link+Codec IC7431
Versatile Stream Manager UART2 transmitted data to DVIO board	CTL(0:1)
VSOUT	Link interface control lines
Vertical synchronisation OUT	CTSN
WE	Clear to Send
Write Enable	D(0:15)
Y_IN	Flash data lines of Link+Codec IC7431
Luminance input from analog board	DV_STATUS
Y_OUT	Interrupt pin for reading DV-status
Luminance output from Host Decoder	HS_CLK
Y_OUT_B	Video clock input of Link+Codec IC7431
Filtered luminance output	INT
YY_OUT(9:0)	Interrupt request output of Link+Codec IC7431 (input to Micro-Controller)
Luminance output from FLI	IOR
Divio 1.8 Board	Parallel interface IO read control input of Link+Codec IC7431
2V5	ISPN
+2V5 Power supply for Link+Codec IC7431	In System Programming signal (used for programming IC7802)
3V3	LKON
+3V3 Power supply	Link-on signal output
3V3_A	LPS
+3V3 Analog power supply for PHY IC7400	Link power status input
3V3_D	LREQ
+3V3 Digital power supply for PHY IC7400	Link request input
3V3_DLY	MA(0:10)
+3V3 Power supply for IC7500	SDRAM address lines of Link+Codec IC7431
3V3_LINK	MCAS
+3V3 Power supply for Link+Codec IC7431	SDRAM column address strobe signal
3V3_F	MCLK
+3V3 Power supply for optional Flash memory IC7432	SDRAM clock signal
3V3_RAM	MD(0:15)SDRAM data lines of Link+Codec IC7431
+3V3 Power supply for SDRAM IC7430	MRAS
3V3_uP	SDRAM row-address strobe signal
+3V3 Power supply for Micro-controller IC7802	MWE
3V3_32kHz	SDRAM write enable signal
+3V3 Power supply for audio format adaptation circuitry IC7507 & IC7508	PCM1
3V3_AC	Audio Serial Data Output of Link+Codec IC7431
+3V3 Power supply for audio system clock generator IC7605 & IC7606	PCM1_NEW
+5V	"MSB justified" to I2S converted audio serial data; audio serial data input of audio DAC UDA1334A
+5V Power supply	PD(0:15)
5V_PLL	Data bus lines for Host I/F of Link+Codec IC7431
+5V Power supply for VCO of audio PLL IC7604	PHY_D(0:7)
A(1:17)	Data bus connection between PHY and LNK device
Flash address lines of uPD72893	RESETn
A_MUTE	DVIO board reset
Audio Mute	RESET_FM
ABCK	Reset signal driven by Flashmaster programming device
Audio Bit Clock	RESTB
AD(1:10)	Reset input of Link+Codec IC7431
Address bus lines for Host I/F of Link+Codec IC7431	RTSN
AEMP1	Request to Send
PCM1 emphasis ON/OFF for PCM1 output	RWZ
AFS1	Parallel interface read/write control input of Link+Codec IC7431
Audio sampling frequency indication signal	RXD
ALRCLK	Receive Data
Audio Word Select	SCLK
AMCLK44	Link control output clock
11,2896MHz (=256*44.1kHz) audio master clock signal for 44.1kHz audio	TXD
AMCLK48	Transmit Data
12,288MHz (=256*48kHz) audio master clock signal for 32kHz and 48kHz audio	VPP
APWM	+10V switchable programming voltage of microcontroller
PWM signal for audio PLL	YUV(0:7)
BUFENn_AUD	Digital Video
Buffer Enable Audio	
BUFENn_VID
